CSC 252: Computer Organization
Spring 2021: Lecture 12

Instructor: Yuhao Zhu

Department of Computer Science
University of Rochester

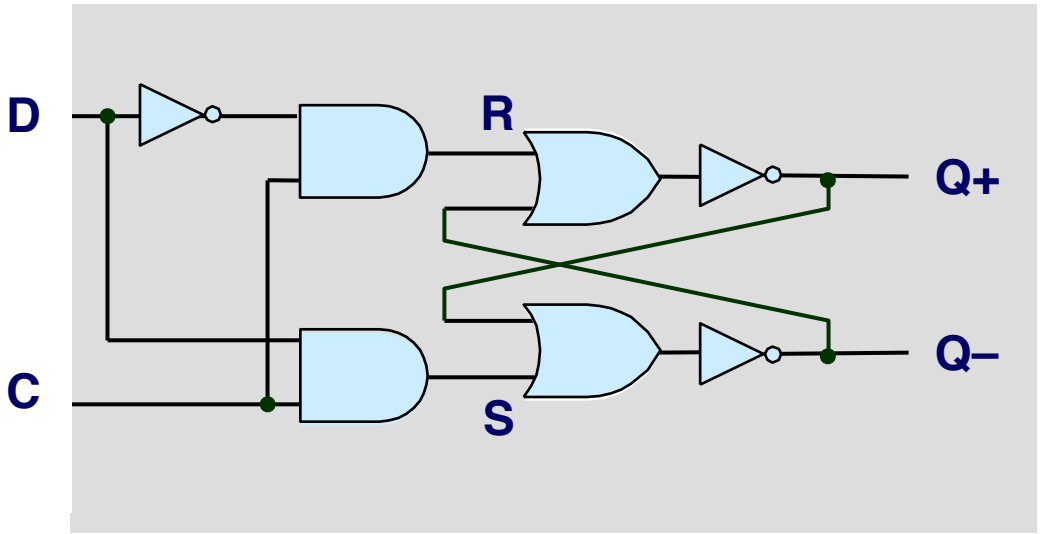
Announcement

- Programming assignment 3 is out
  - Details: https://www.cs.rochester.edu/courses/252/spring2021/labs/assignment3.html
  - Due on **March 23**, 11:59 PM
  - You (may still) have 3 slip days

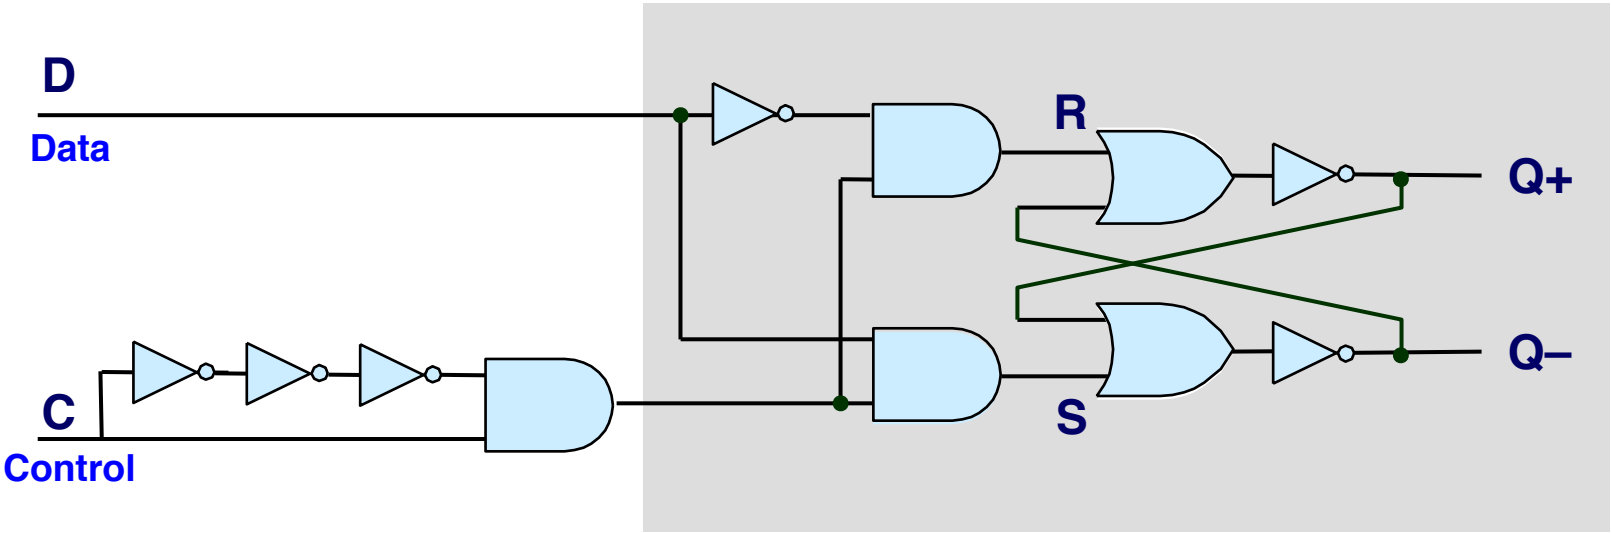
Announcement

- Programming assignment 3 is in x86 assembly language. Seek help from TAs.
- TAs are best positioned to answer your questions about programming assignments!!!
- Programming assignments do NOT repeat the lecture materials. They ask you to synthesize what you have learned from the lectures and work out something new.

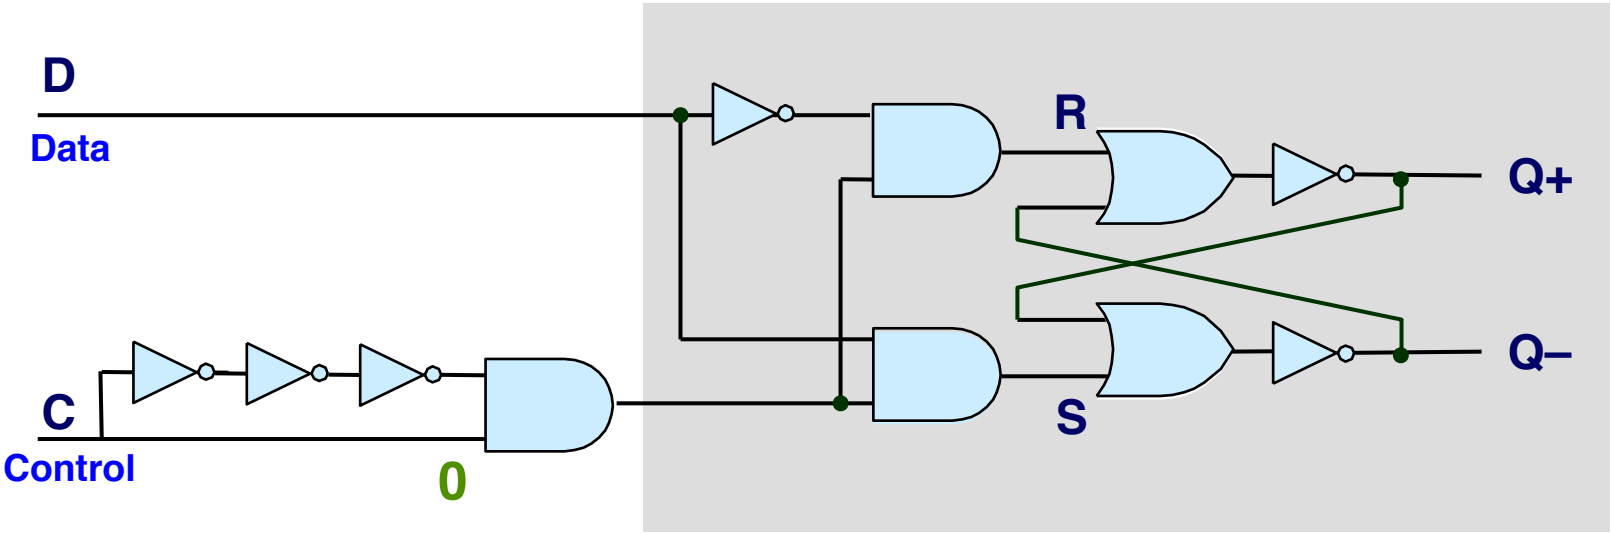
Edge-Triggered Latch (Flip-Flop)



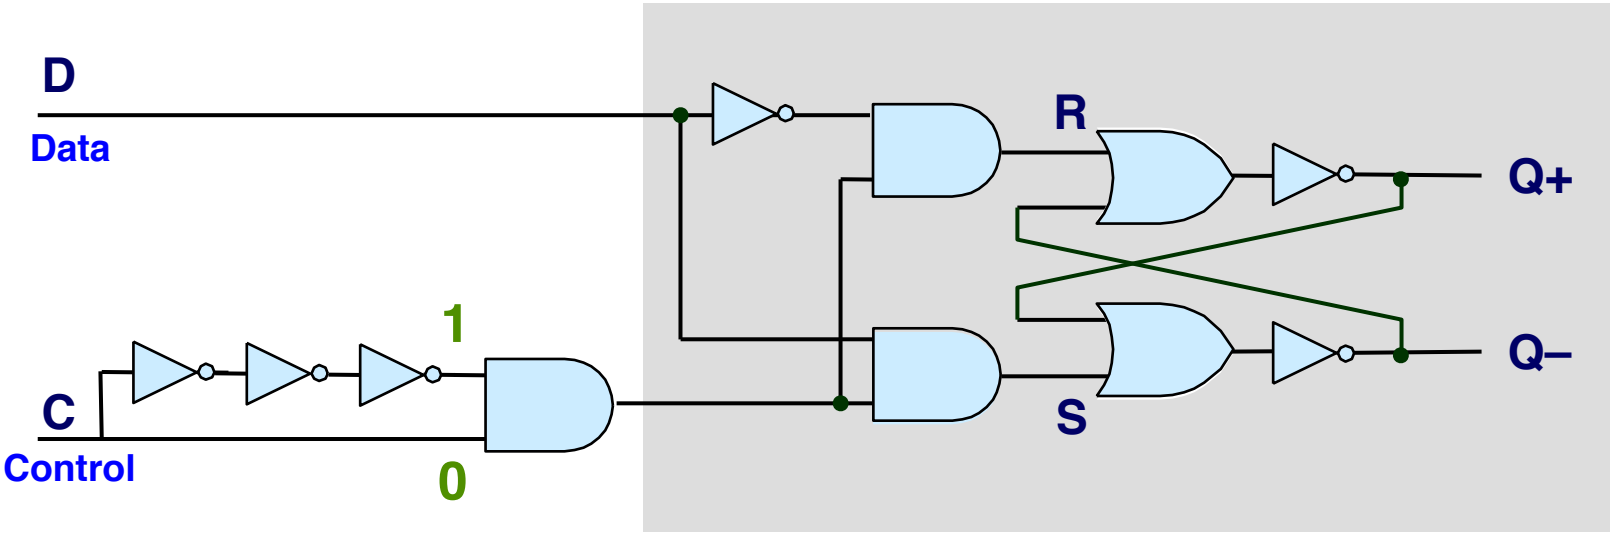
Edge-Triggered Latch (Flip-Flop)



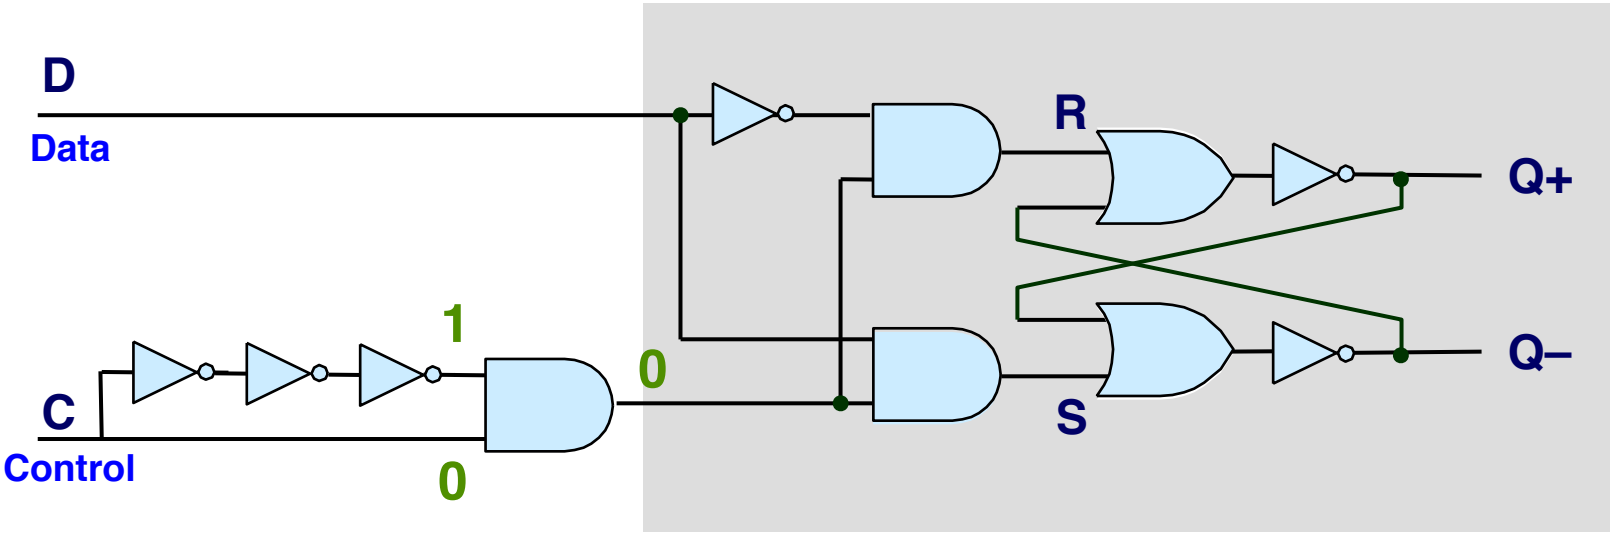
Edge-Triggered Latch (Flip-Flop)



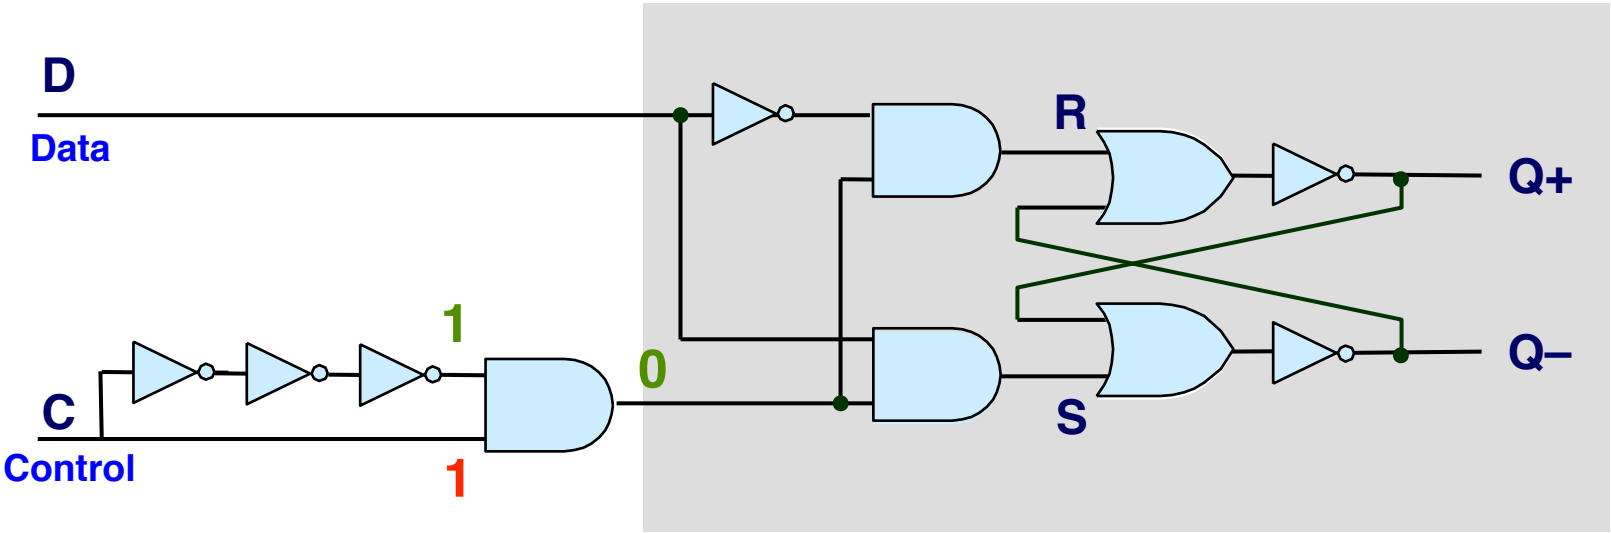
Edge-Triggered Latch (Flip-Flop)



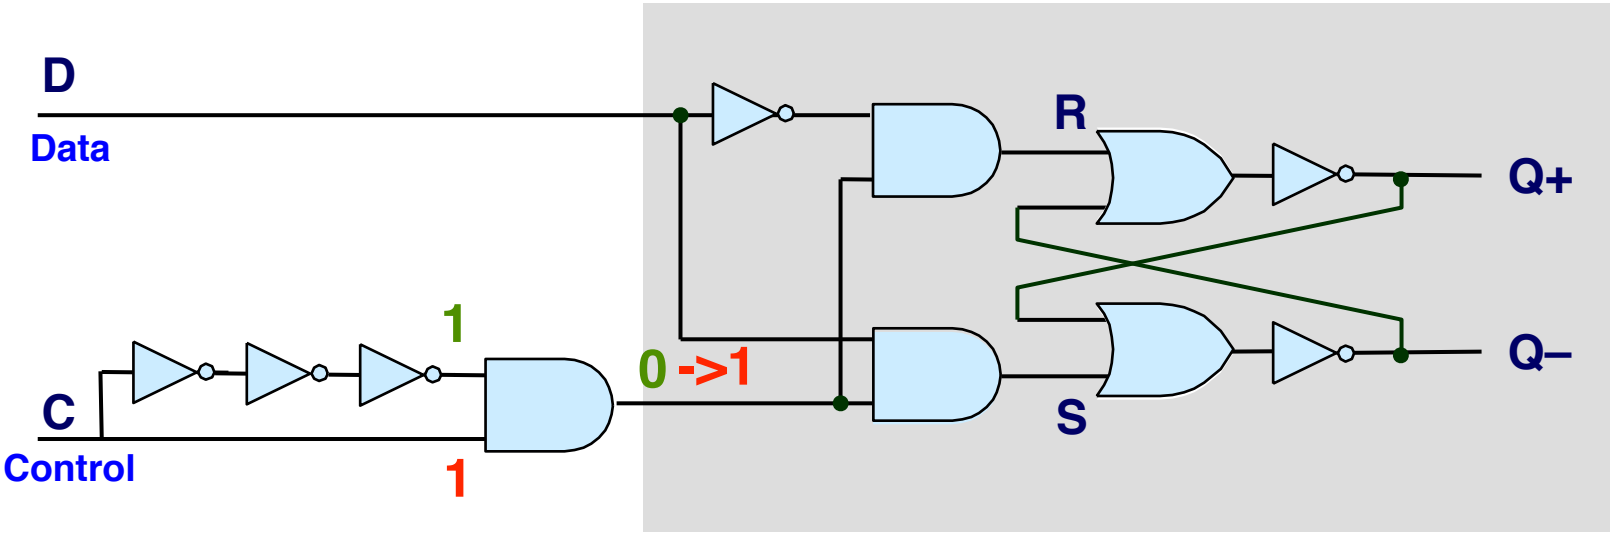
Edge-Triggered Latch (Flip-Flop)



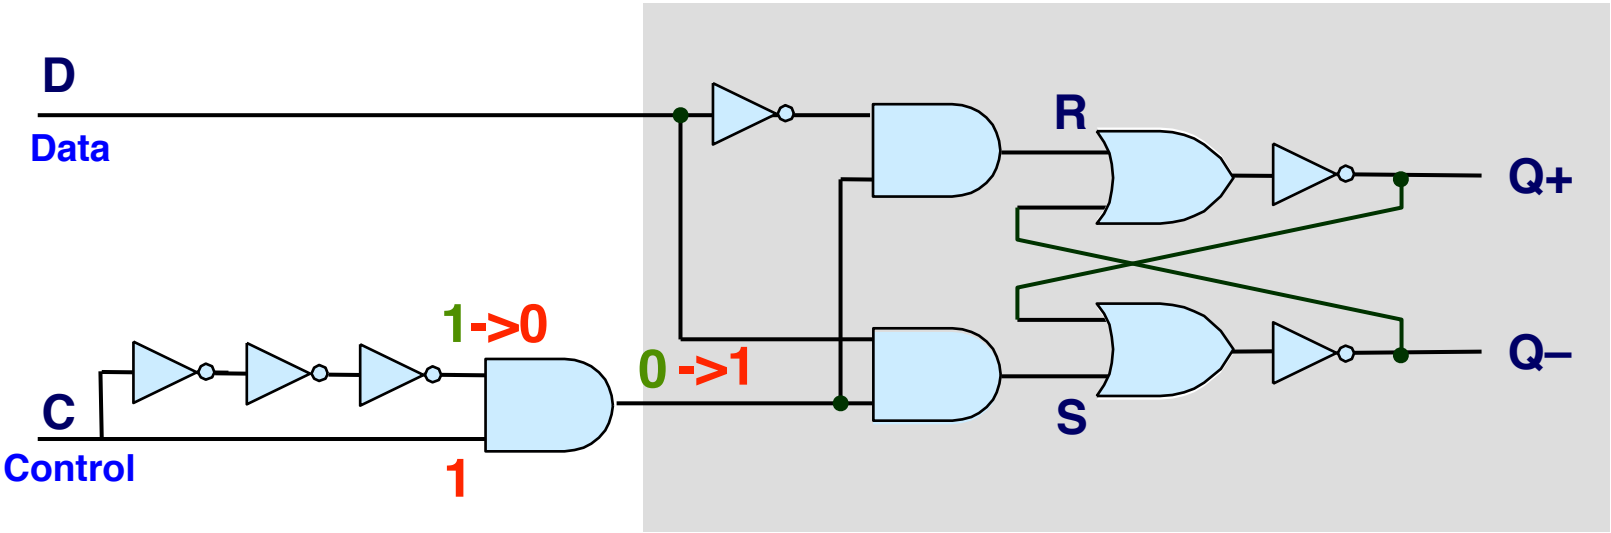
Edge-Triggered Latch (Flip-Flop)



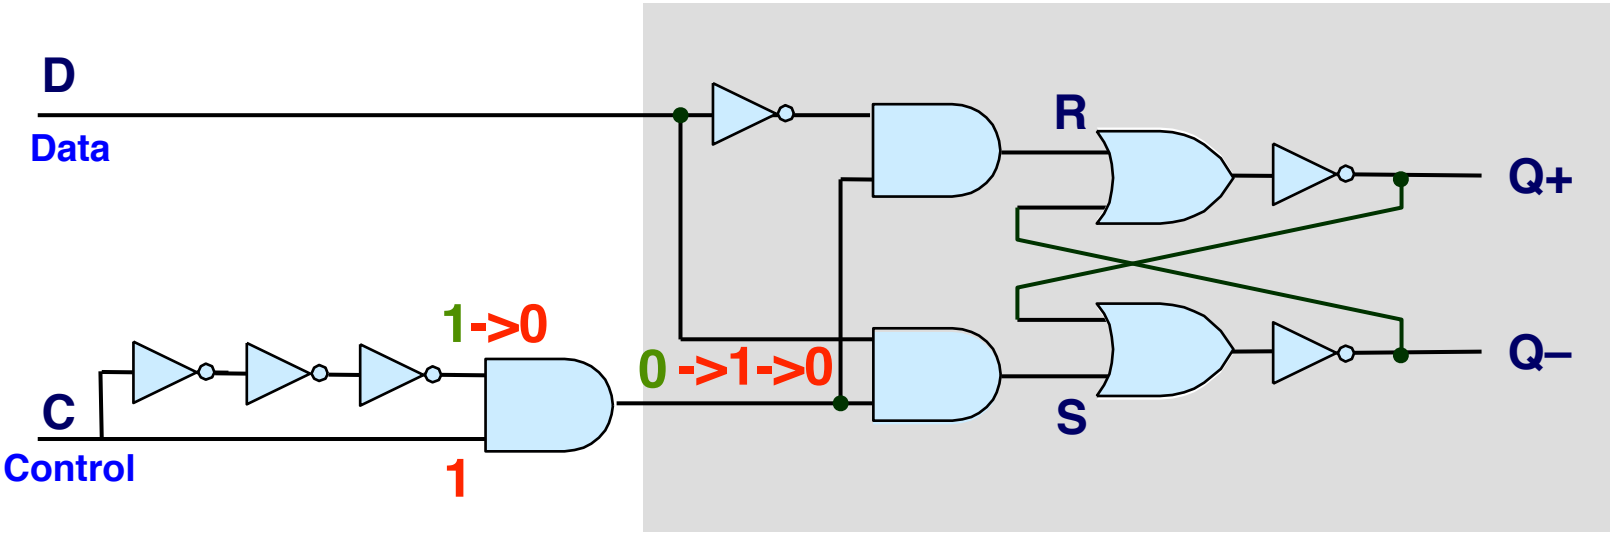
Edge-Triggered Latch (Flip-Flop)



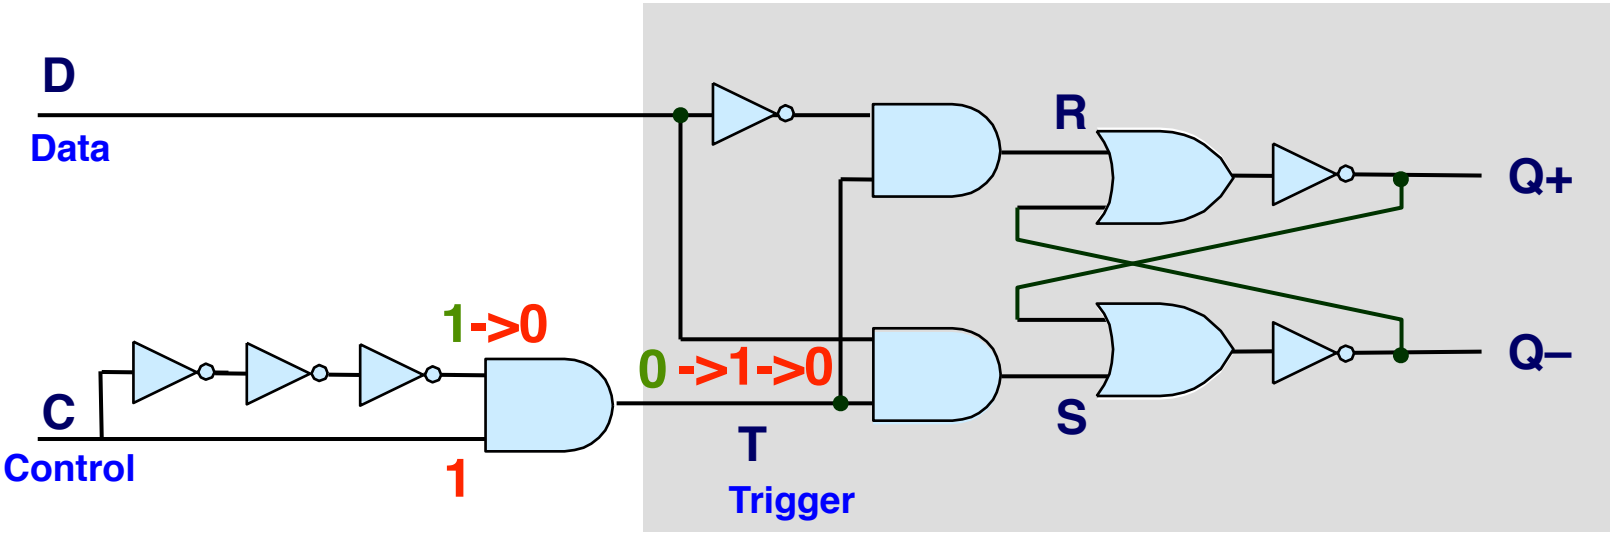
Edge-Triggered Latch (Flip-Flop)

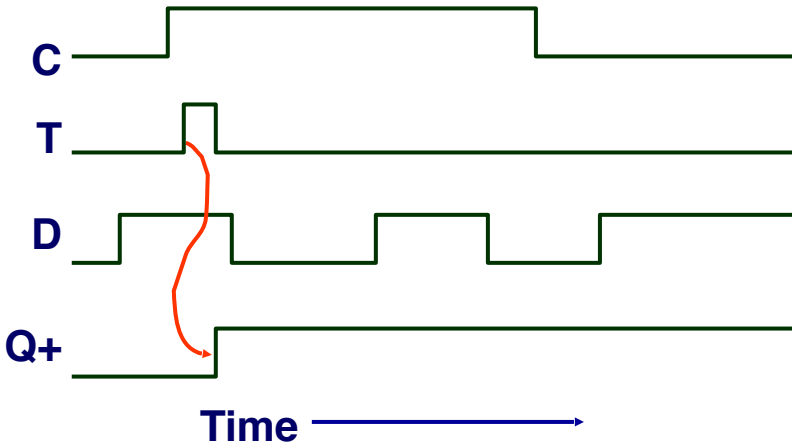


Edge-Triggered Latch (Flip-Flop)

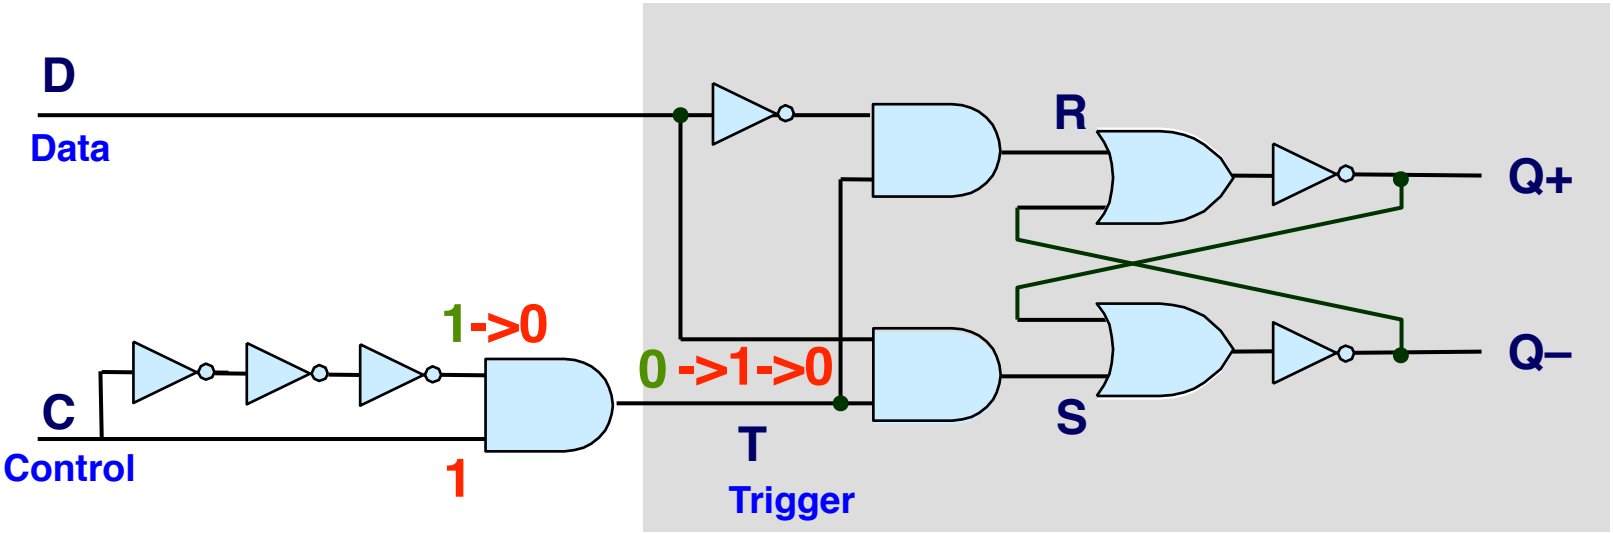


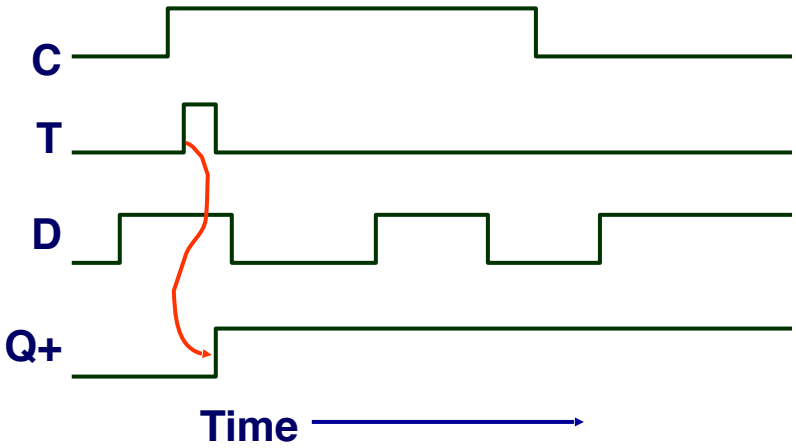
Edge-Triggered Latch (Flip-Flop)





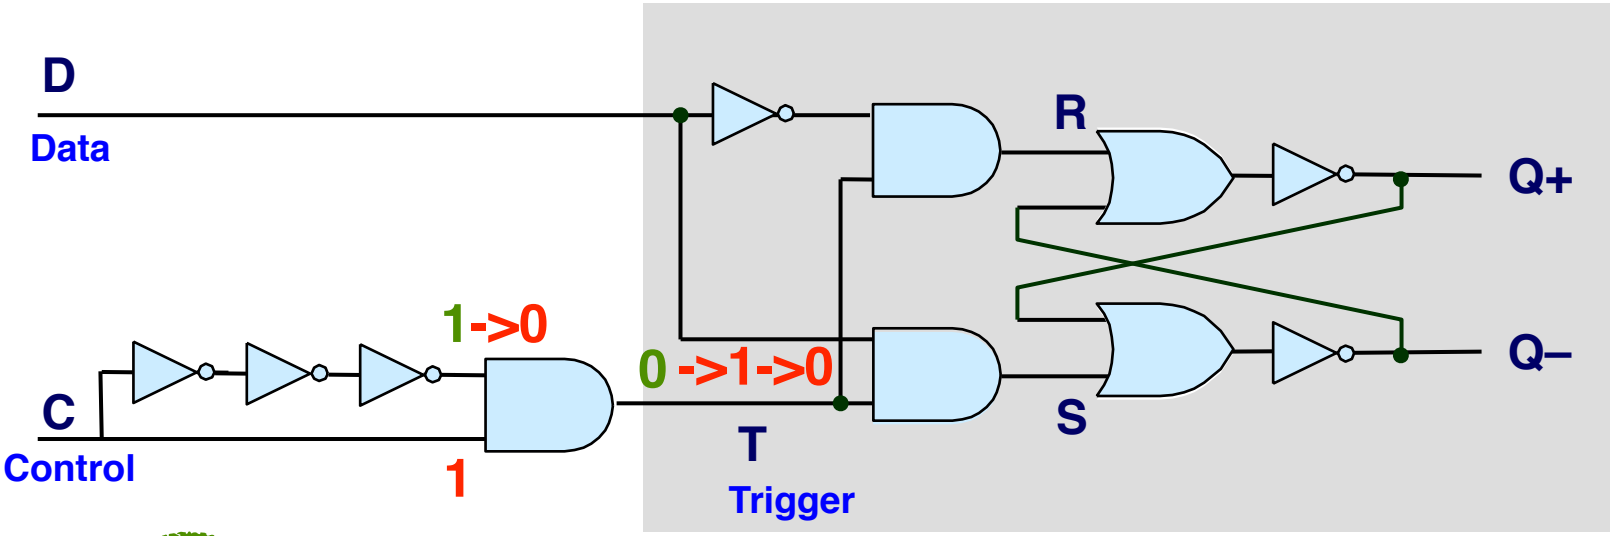
Edge-Triggered Latch (Flip-Flop)

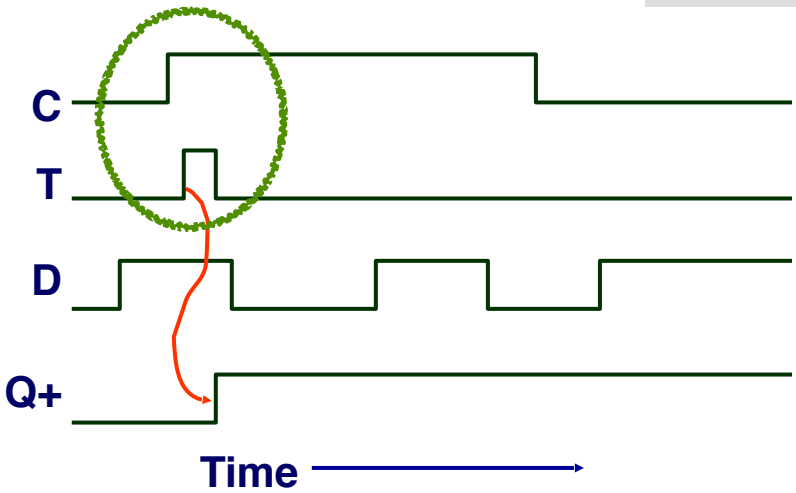




- Flip-flop: Only latches data for a brief period

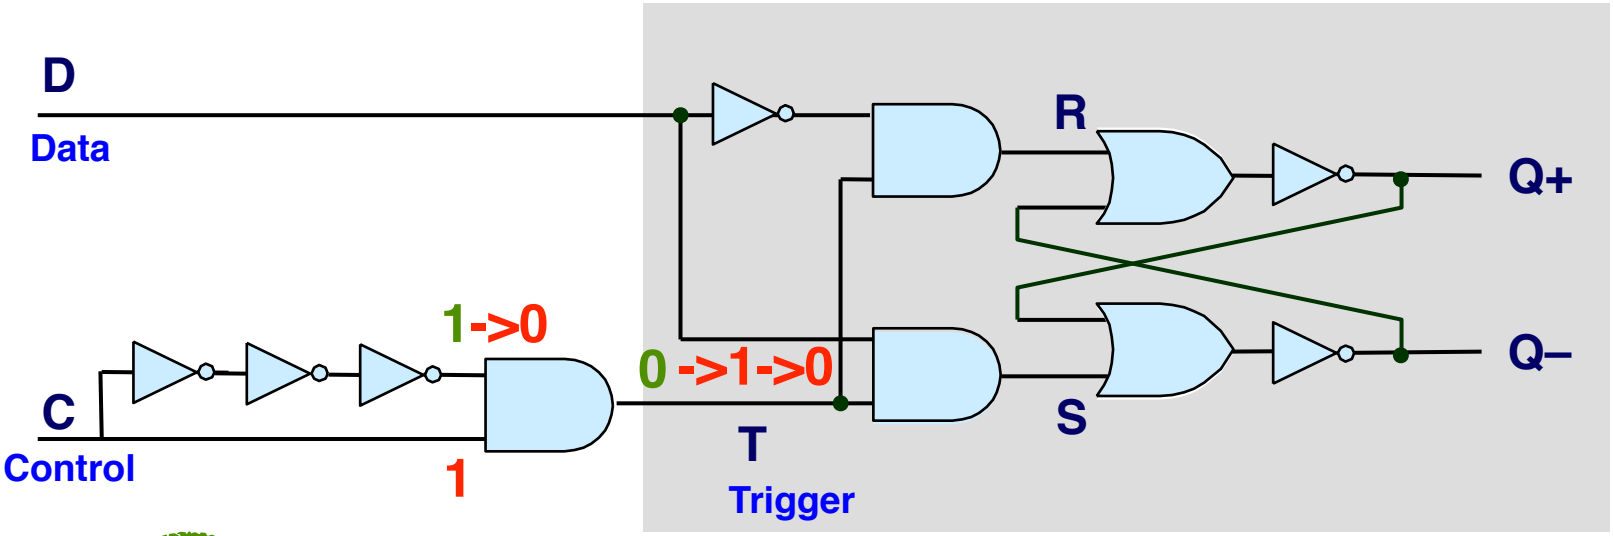
Edge-Triggered Latch (Flip-Flop)

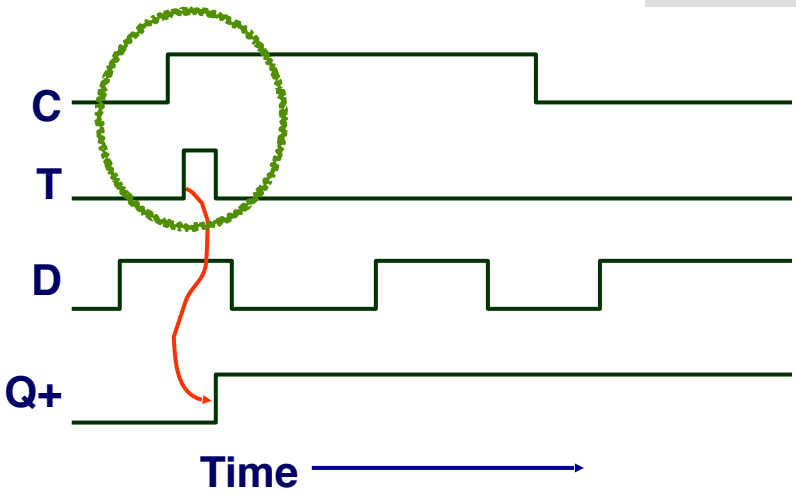




- Flip-flop: Only latches data for a brief period
- Value latched depends on data as C **rises** (i.e., 0–>1); usually called at the **rising edge** of C

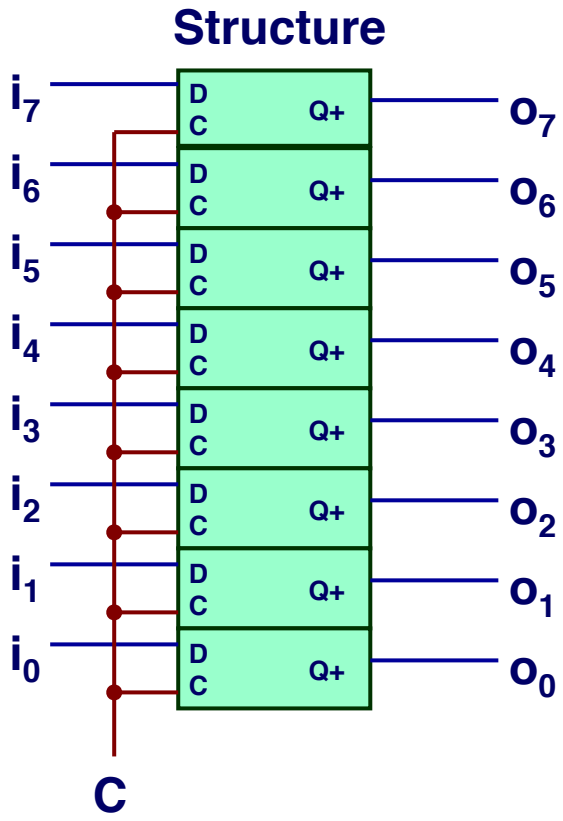
Edge-Triggered Latch (Flip-Flop)





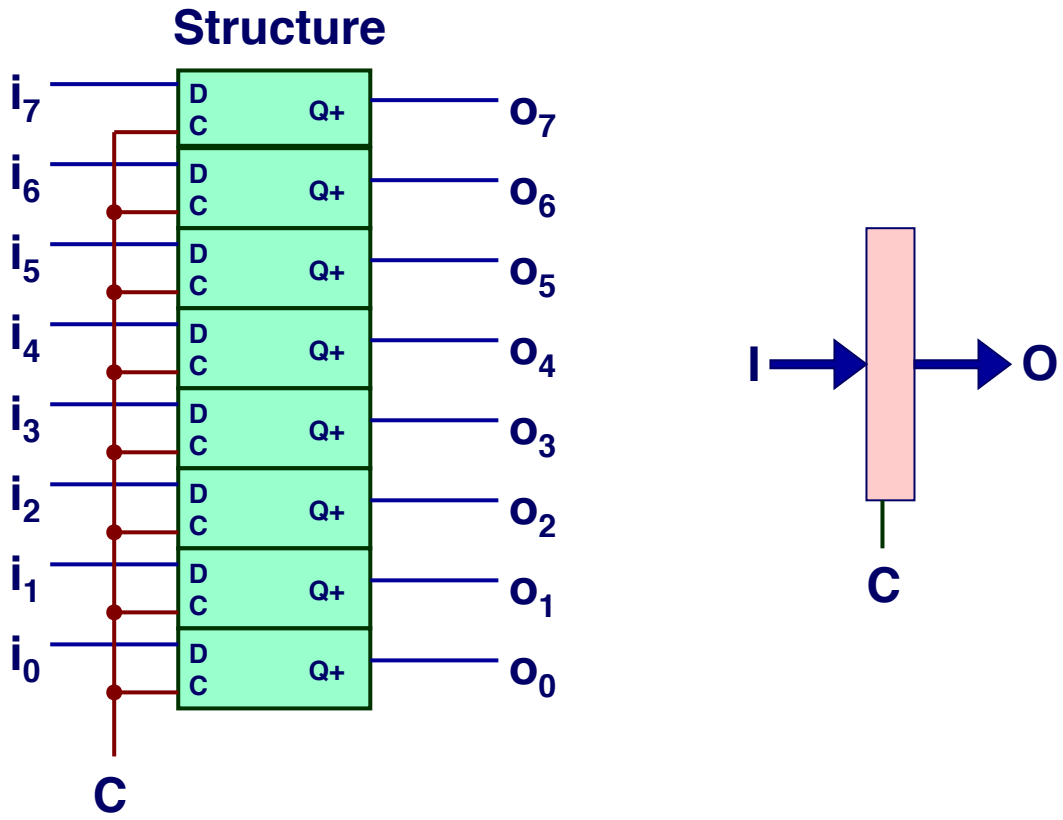
- Flip-flop: Only latches data for a brief period
- Value latched depends on data as C **rises** (i.e., 0–>1); usually called at the **rising edge** of C
- Output remains stable at all other times

Registers



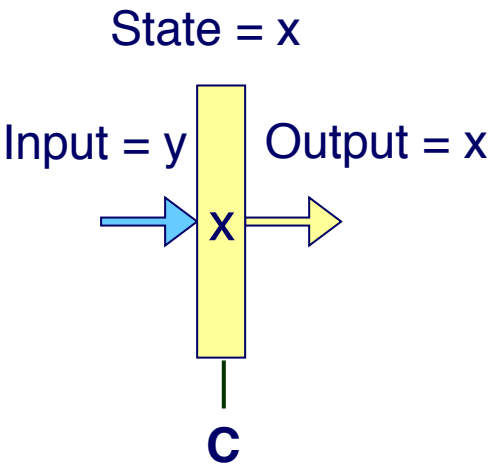
- Stores several bits of data
- Collection of edge-triggered latches (D Flip-flops)
- Loads input on rising edge of the C signal

Registers

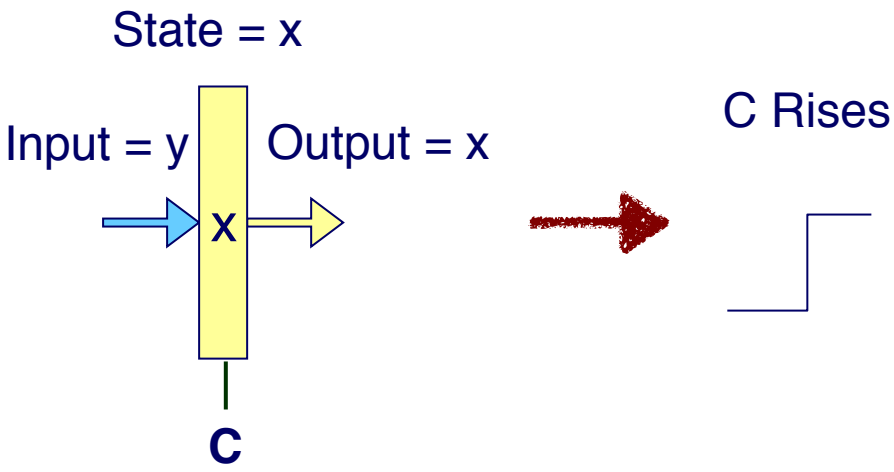


- Stores several bits of data
- Collection of edge-triggered latches (D Flip-flops)
- Loads input on rising edge of the C signal

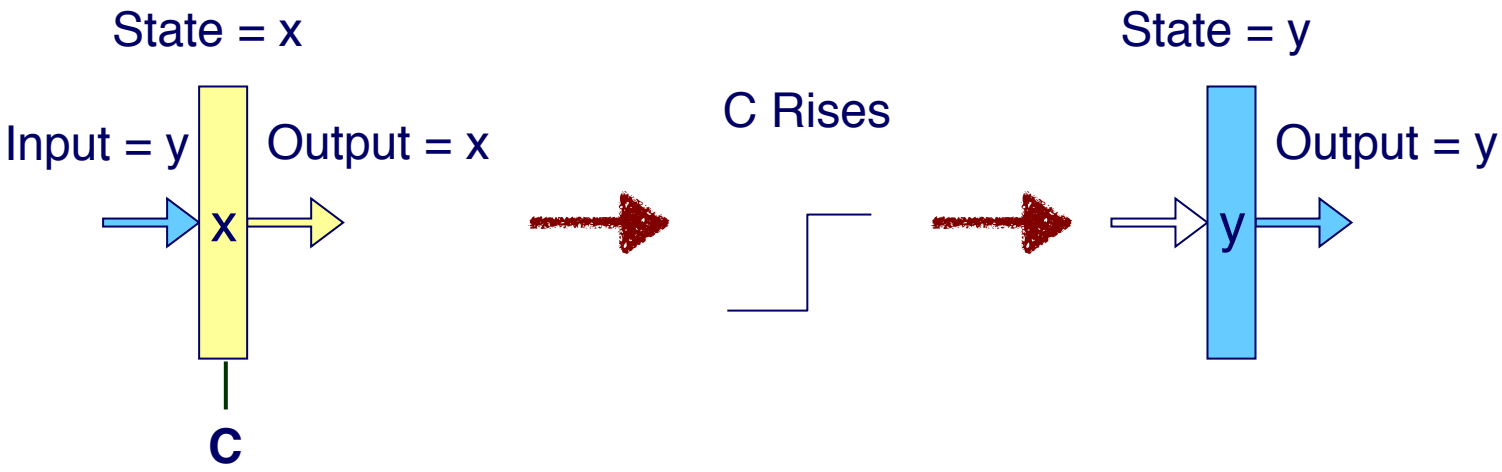
Register Operation



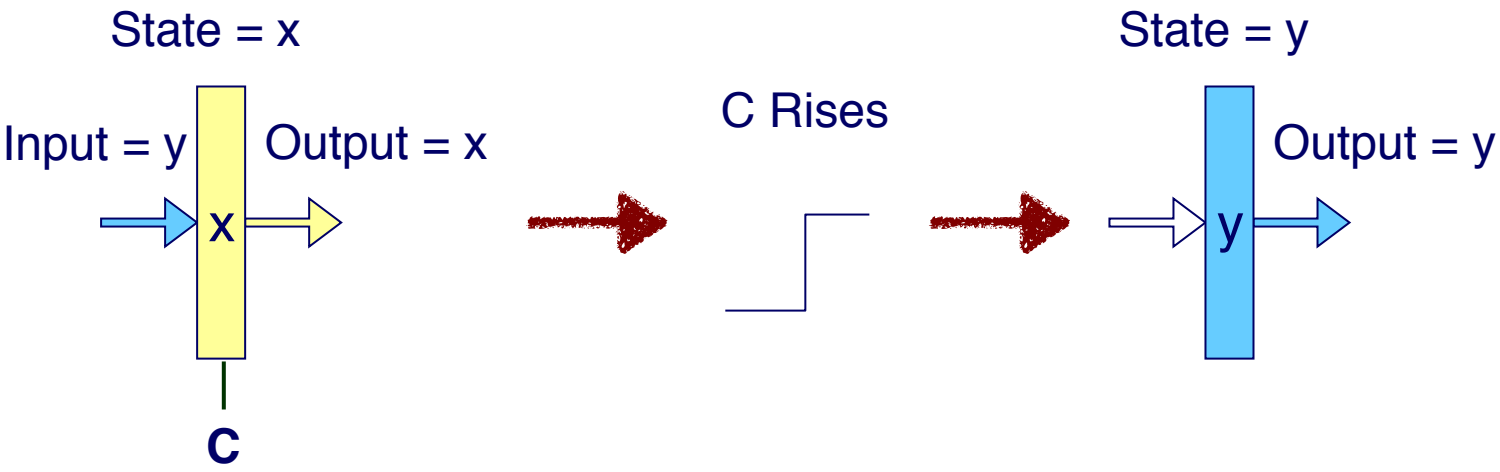
Register Operation



Register Operation

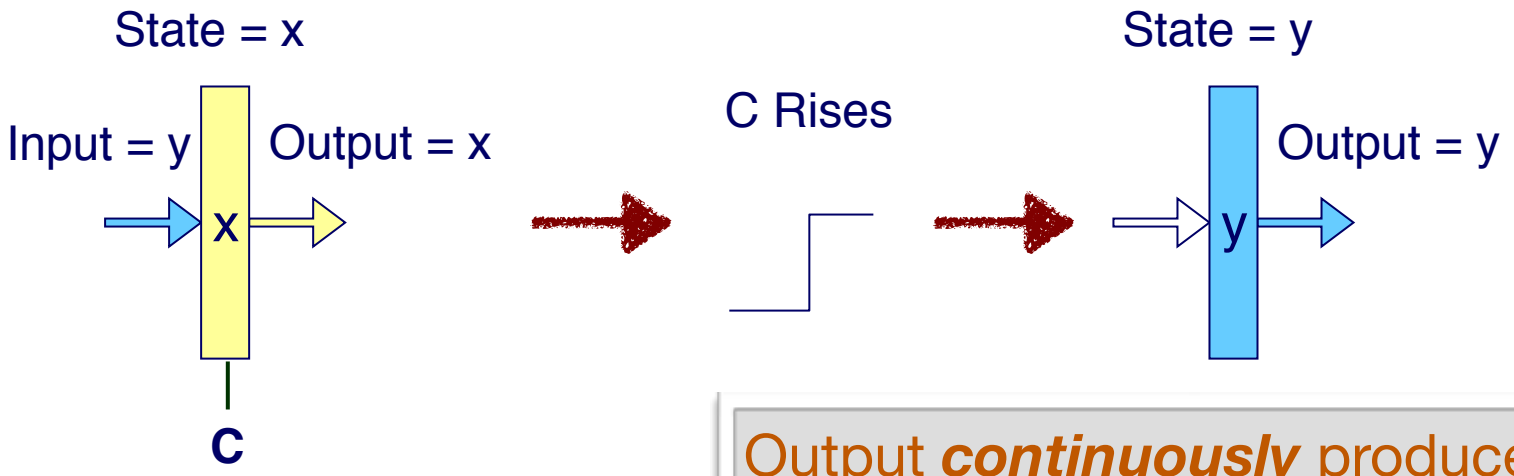


Register Operation



- Stores data bits
- For most of time acts as barrier between input and output
- As C rises, loads input
- So you'd better compute the input before the C signal rises if you want to store the input data to the register

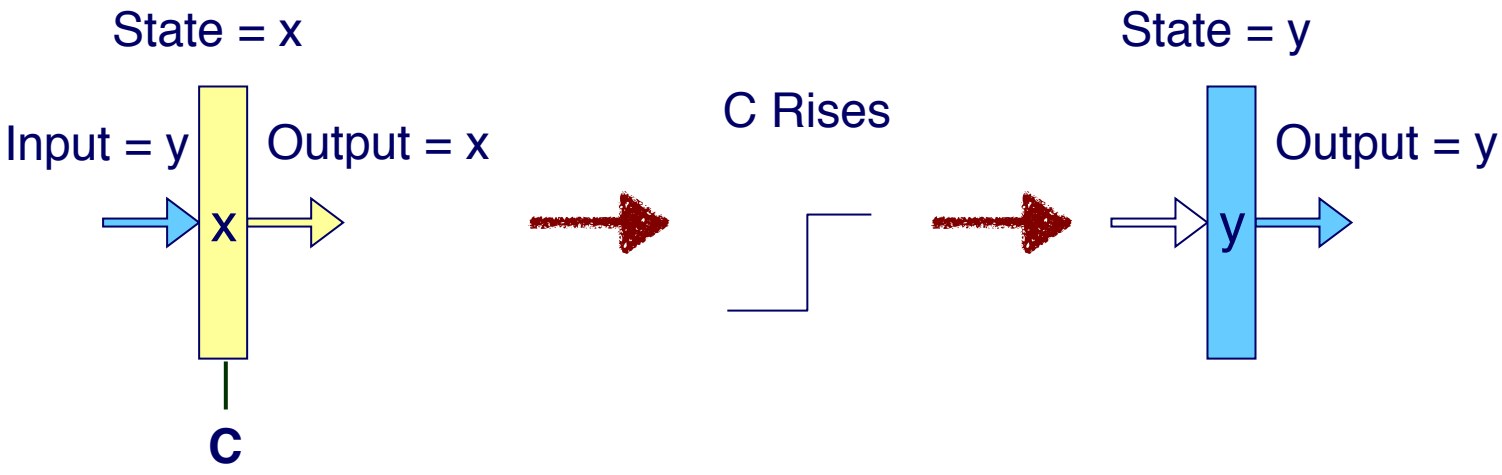
Register Operation



Output ***continuously*** produces y after the rising edge unless you cut off power.

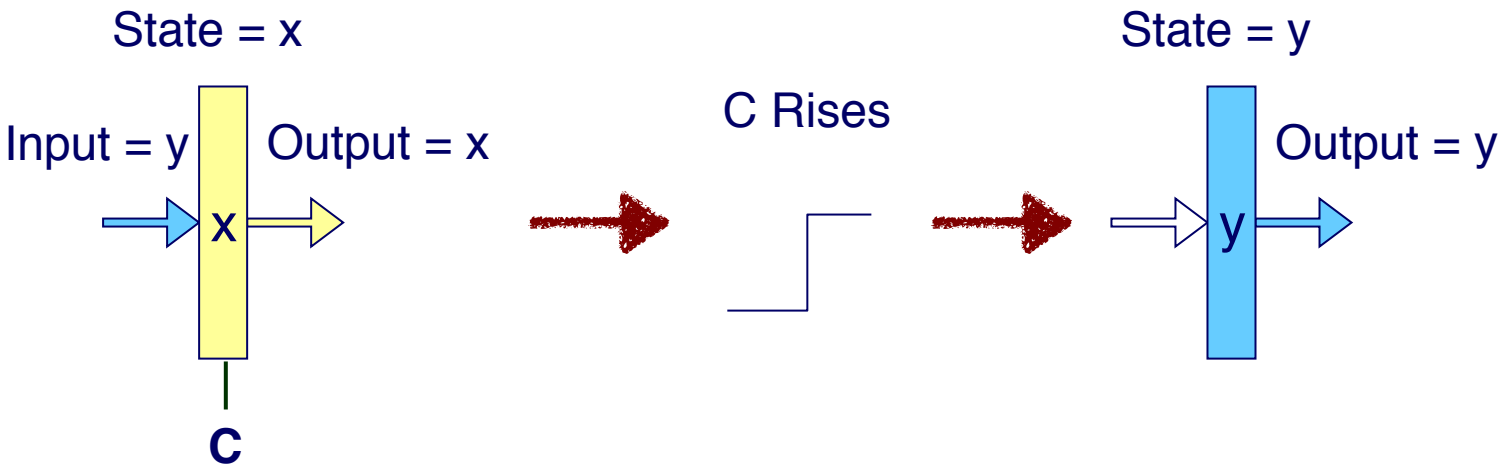
- Stores data bits
- For most of time acts as barrier between input and output
- As C rises, loads input
- So you'd better compute the input before the C signal rises if you want to store the input data to the register

Clock Signal



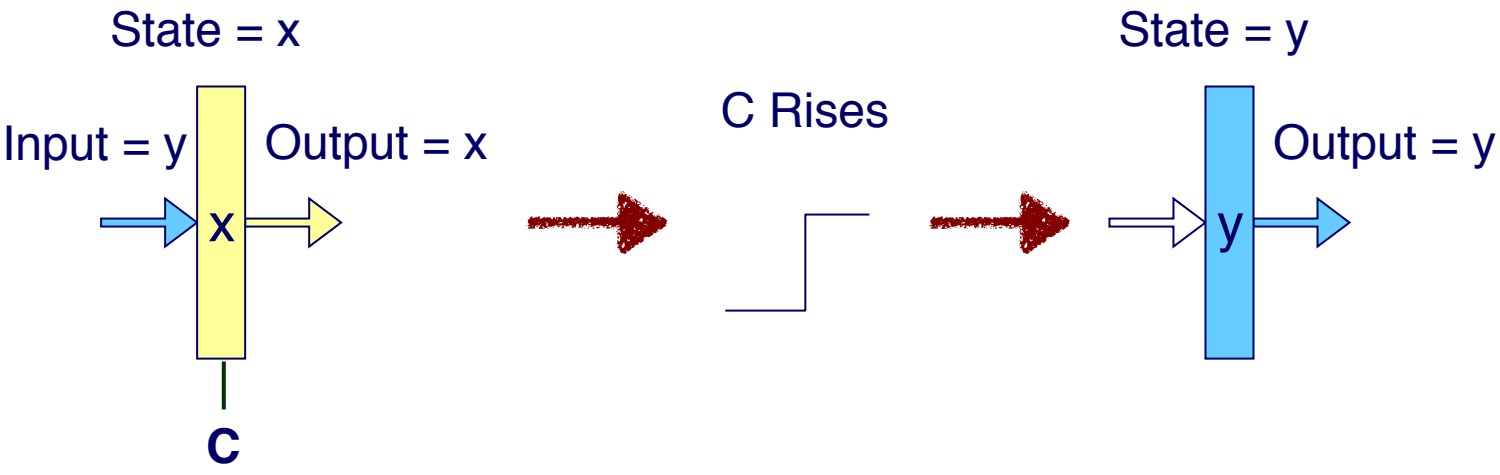
- A special C: periodically oscillating between 0 and 1
- That's called the **clock** signal. Generated by a crystal oscillator inside your computer.

Clock Signal

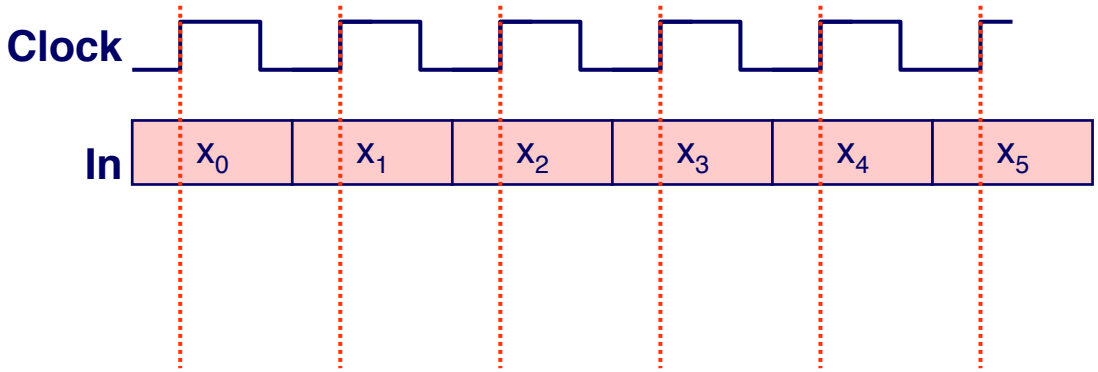


- A special C: periodically oscillating between 0 and 1
- That's called the **clock** signal. Generated by a crystal oscillator inside your computer.

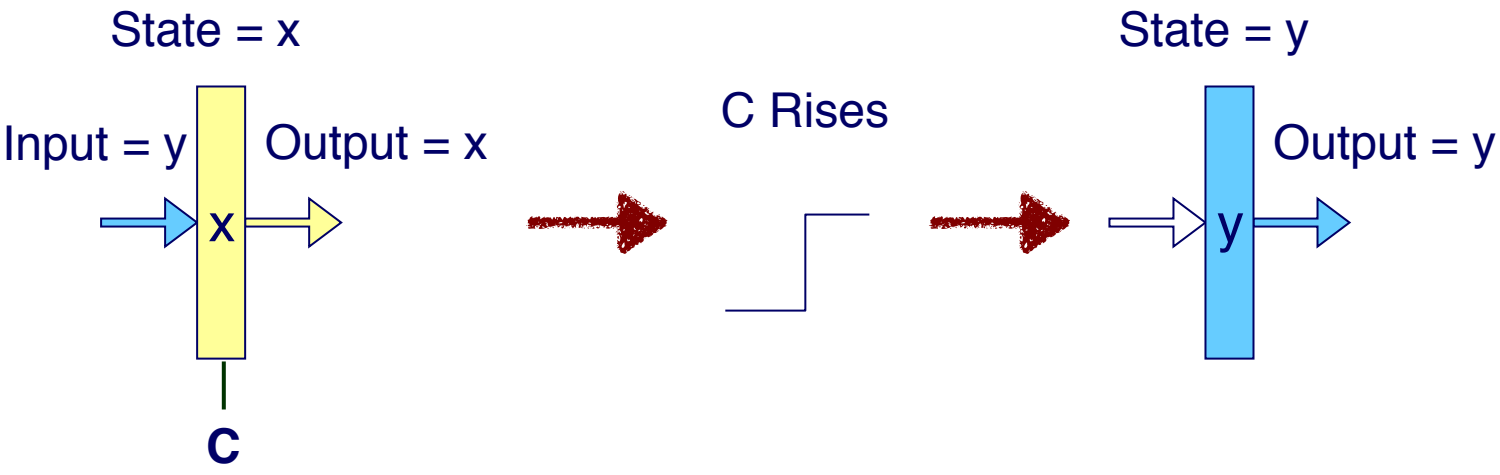
Clock Signal



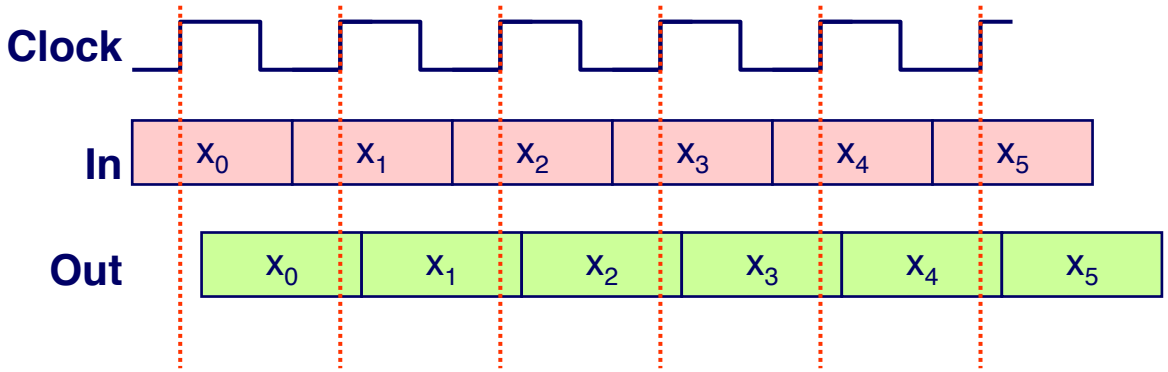
- A special C: periodically oscillating between 0 and 1
- That's called the **clock** signal. Generated by a crystal oscillator inside your computer.



Clock Signal

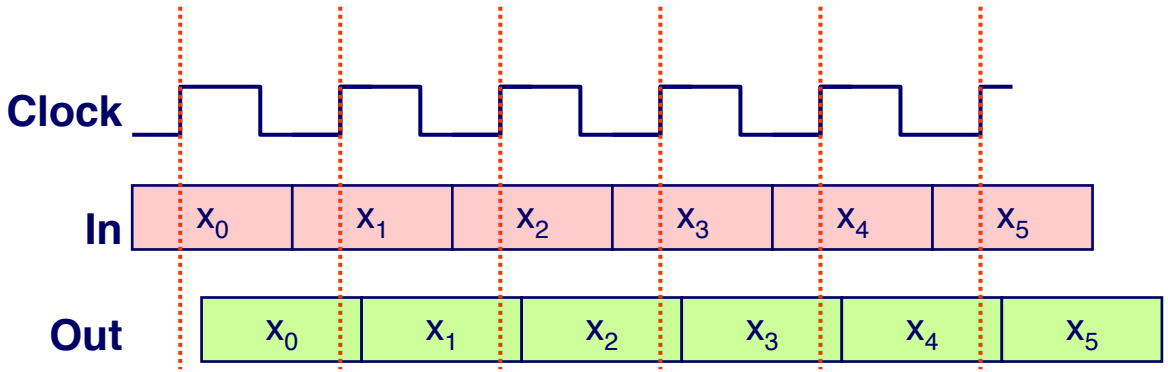


- A special C: periodically oscillating between 0 and 1
- That's called the **clock** signal. Generated by a crystal oscillator inside your computer.



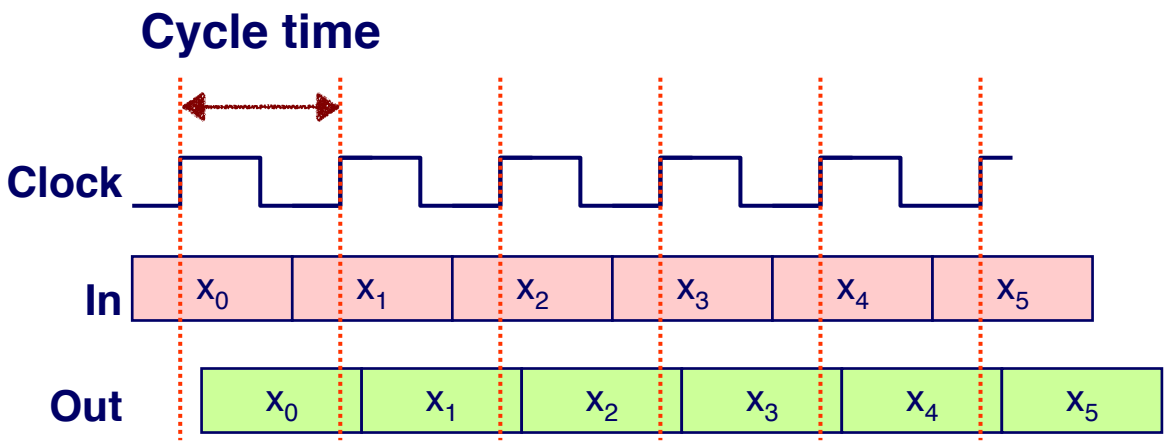
Clock Signal

- Cycle time of a clock signal: the time duration between two rising edges.



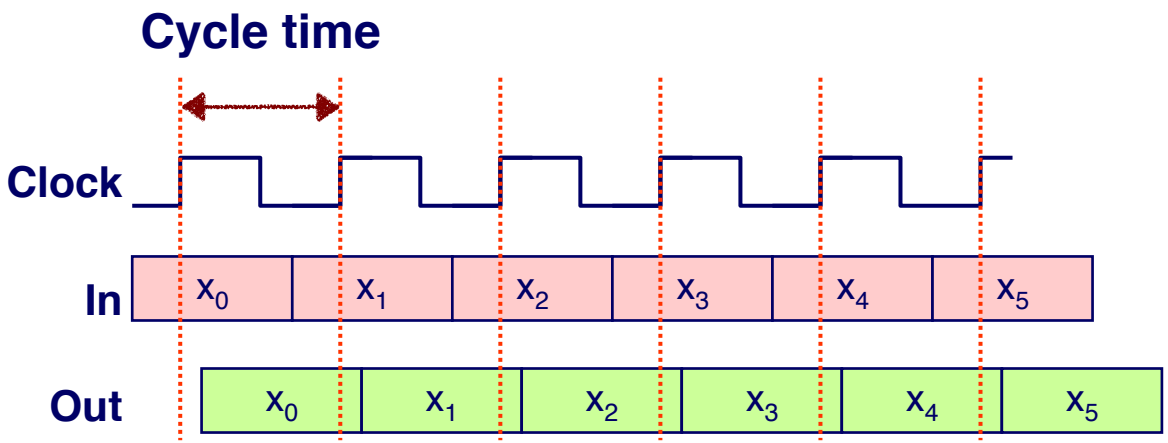
Clock Signal

- Cycle time of a clock signal: the time duration between two rising edges.



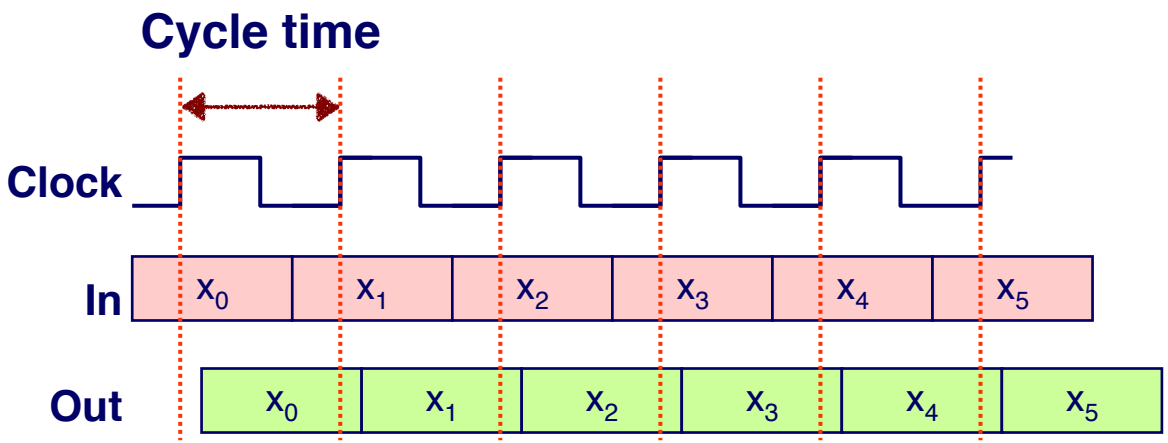
Clock Signal

- Cycle time of a clock signal: the time duration between two rising edges.
- Frequency of a clock signal: how many rising (falling) edges in 1 second.



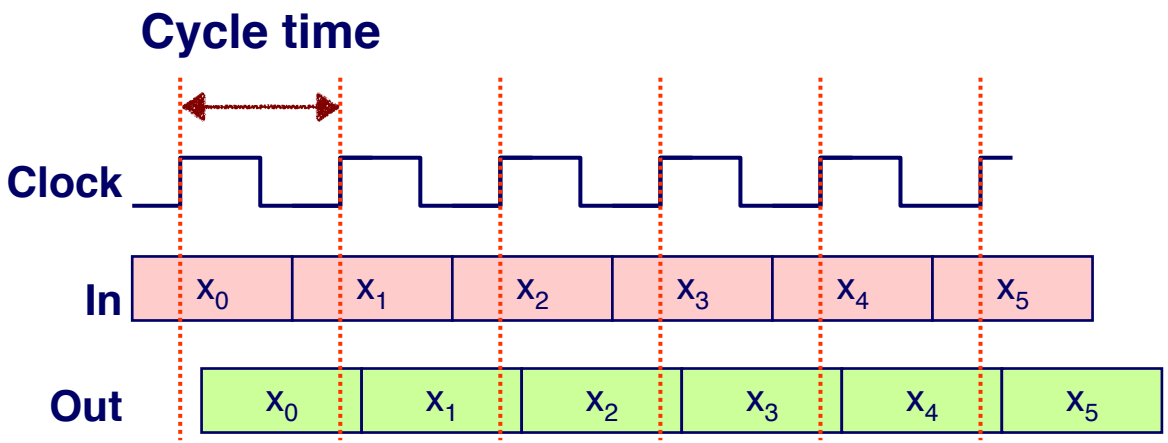
Clock Signal

- Cycle time of a clock signal: the time duration between two rising edges.
- Frequency of a clock signal: how many rising (falling) edges in 1 second.
- 1 GHz CPU means the clock frequency is 1 GHz



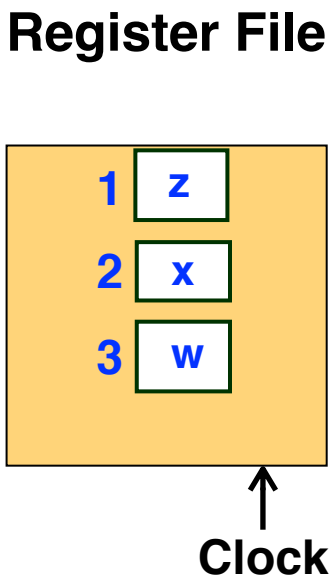
Clock Signal

- Cycle time of a clock signal: the time duration between two rising edges.
- Frequency of a clock signal: how many rising (falling) edges in 1 second.
- 1 GHz CPU means the clock frequency is 1 GHz
  - The cycle time is 1/10^9 = 1 ns



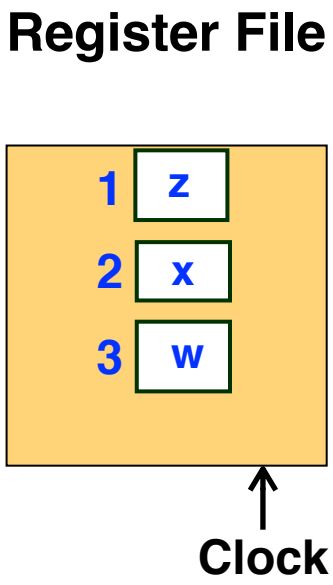
Register File

- A register file consists of a set of registers that you can individual read from and write to.



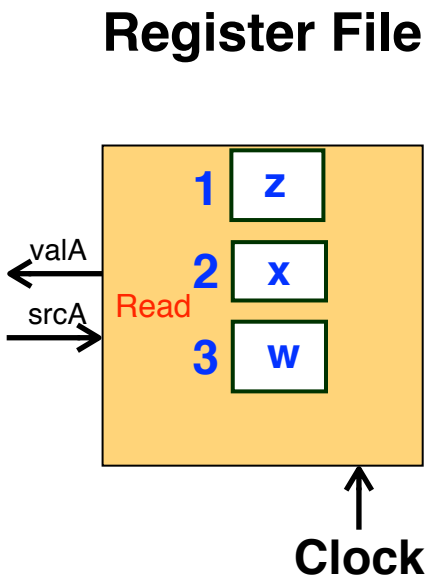
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out



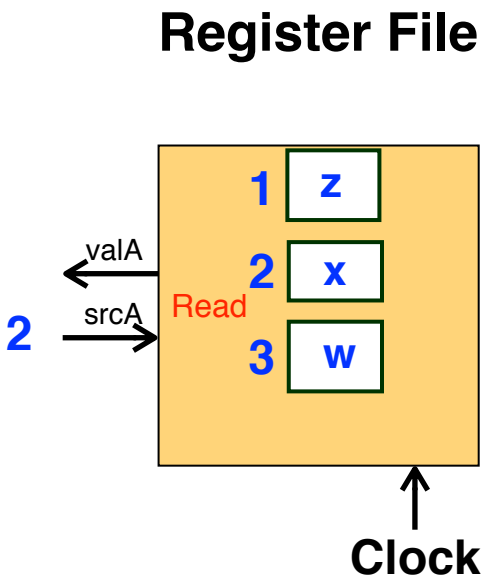
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out



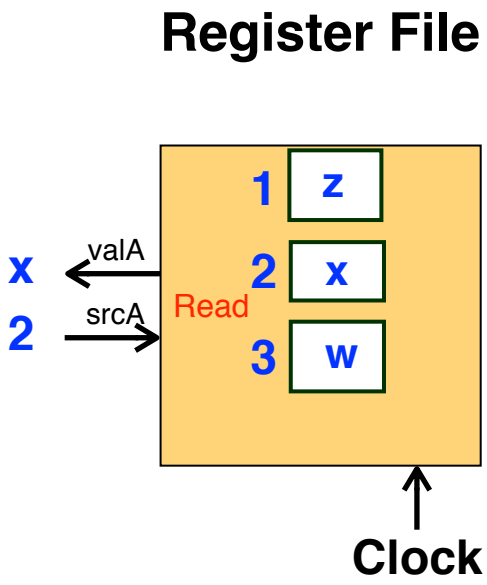
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out



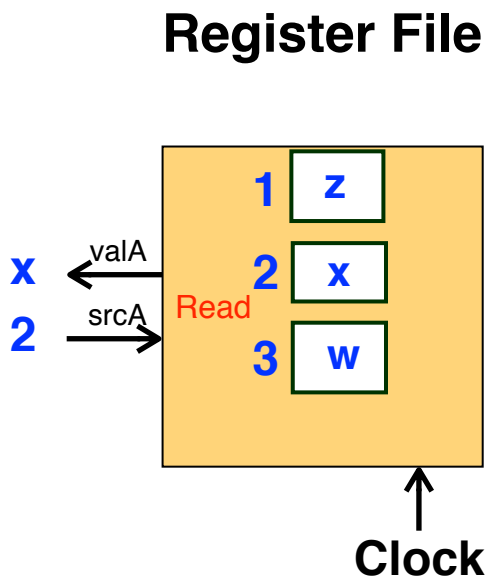
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out



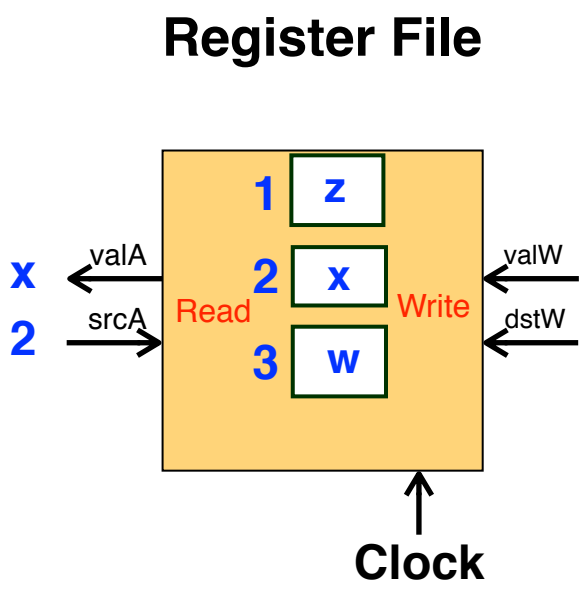
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out
- To write: give a register file ID, a new value, overwrite the old value



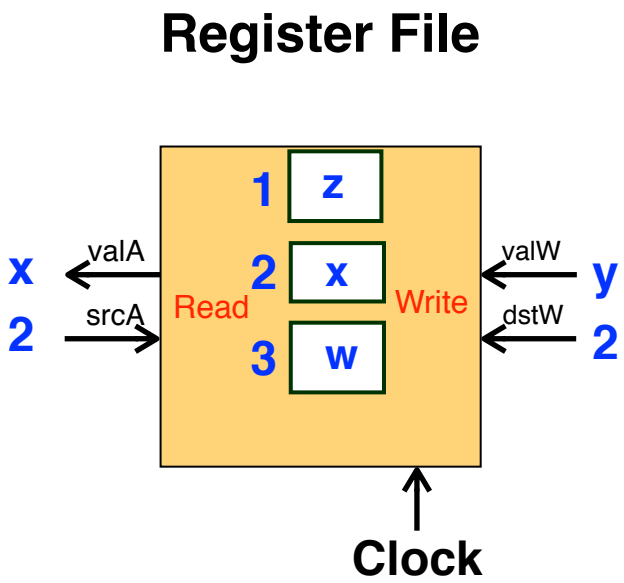
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out
- To write: give a register file ID, a new value, overwrite the old value



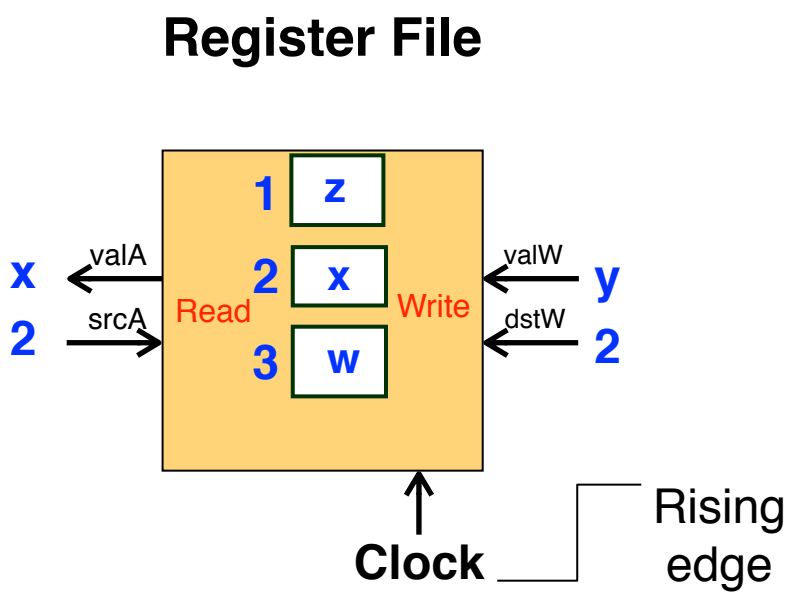
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out
- To write: give a register file ID, a new value, overwrite the old value



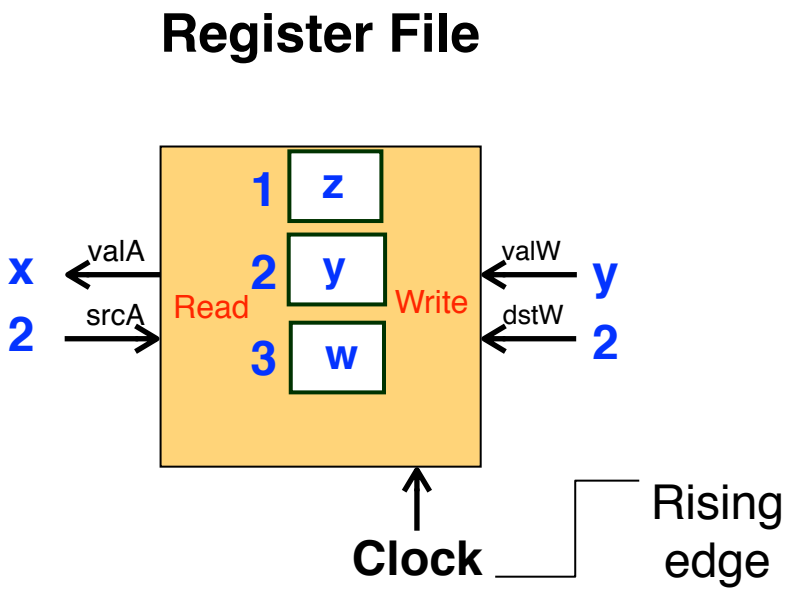
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out
- To write: give a register file ID, a new value, overwrite the old value



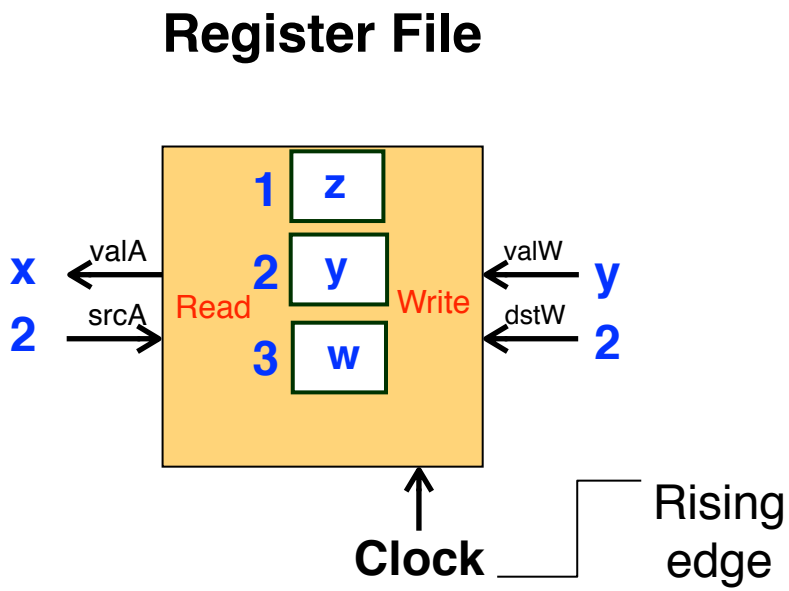
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out
- To write: give a register file ID, a new value, overwrite the old value



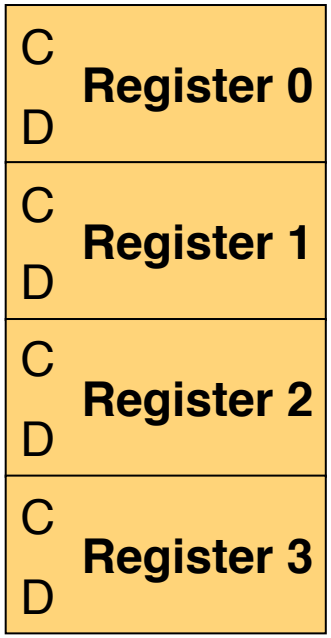
Register File

- A register file consists of a set of registers that you can individual read from and write to.
- To read: give a register file ID, and read the stored value out
- To write: give a register file ID, a new value, overwrite the old value
- How do we build a register file out of individual registers??



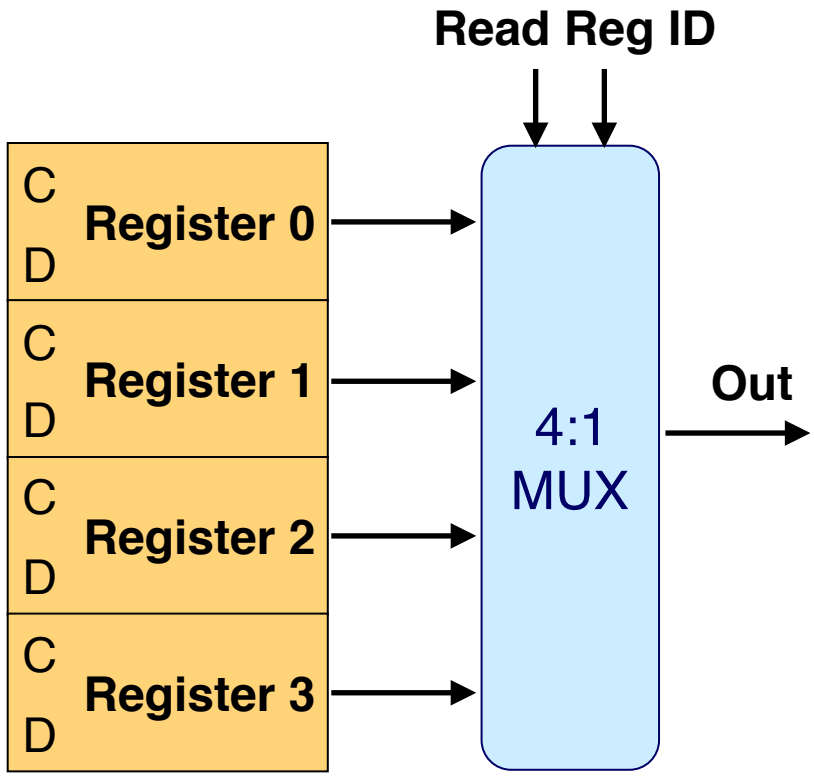
Register File Read

- Continuously read a register independent of the clock signal

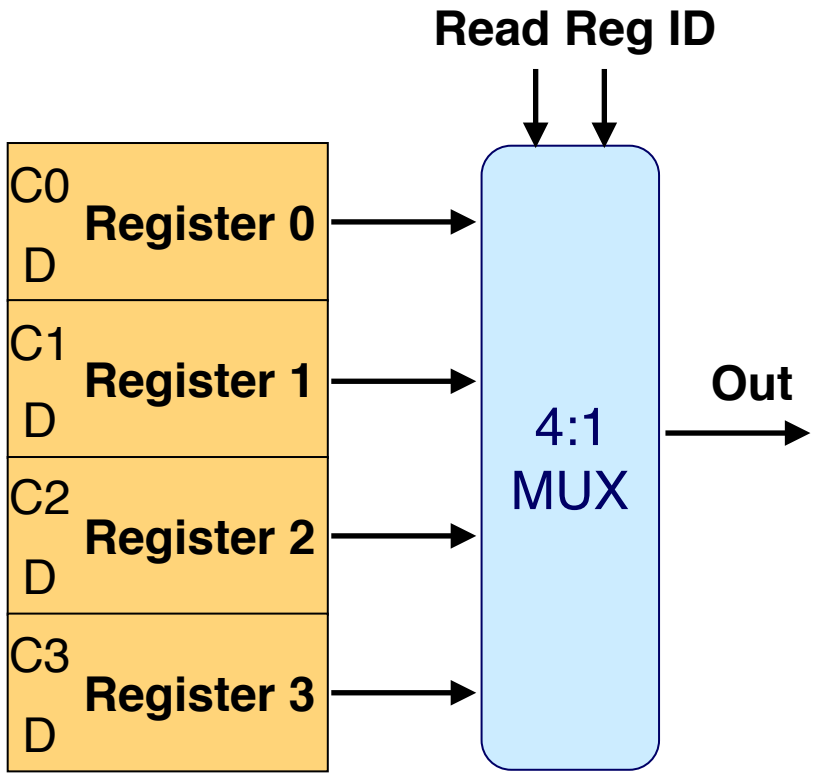


Register File Read

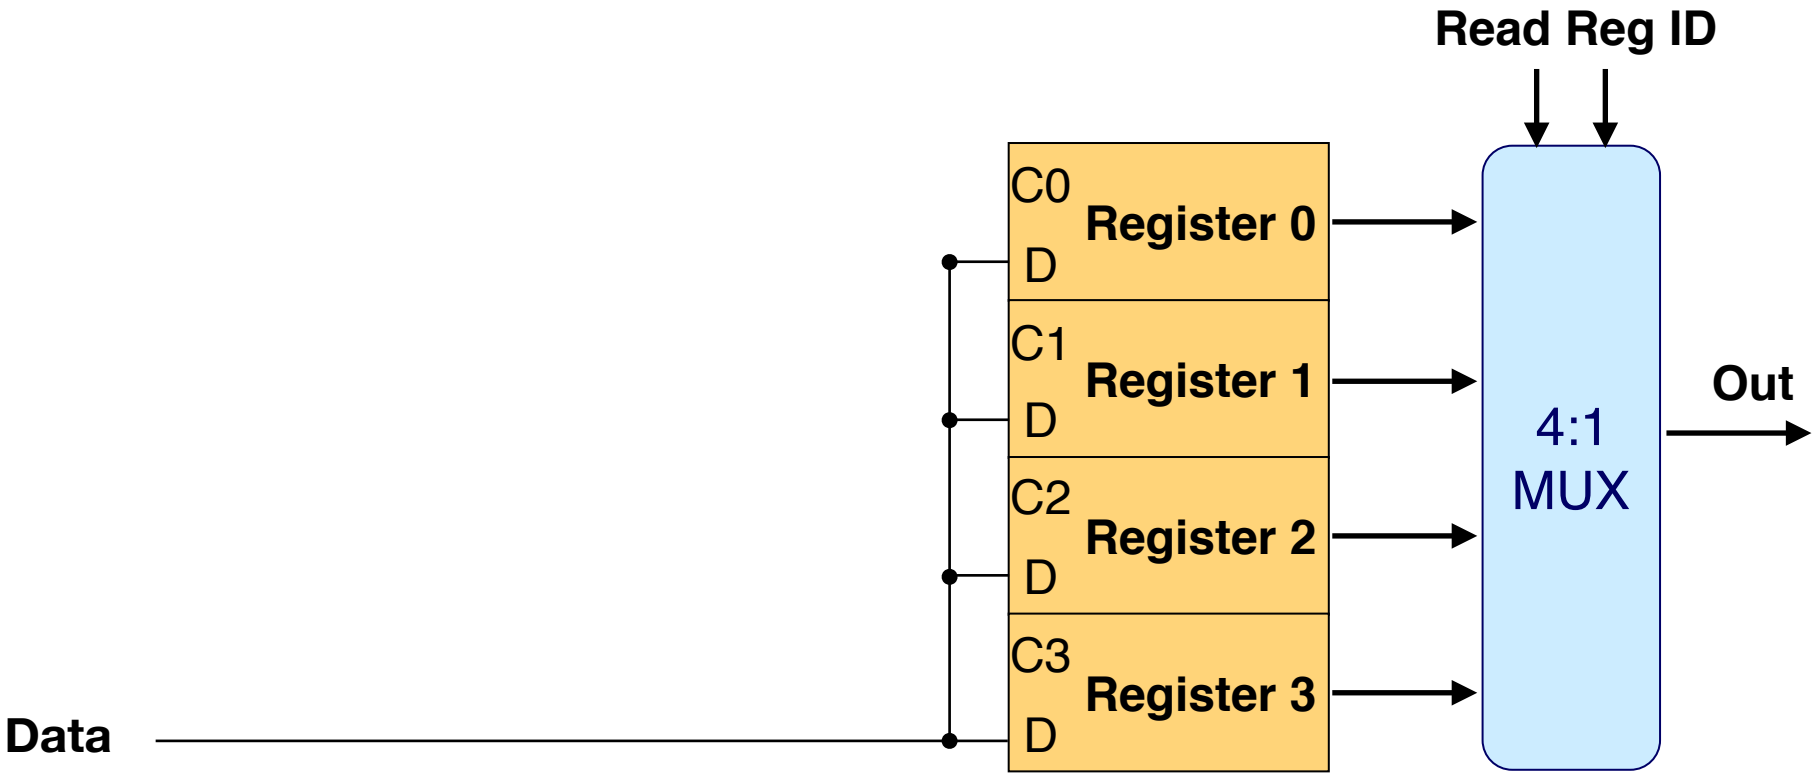
- Continuously read a register independent of the clock signal



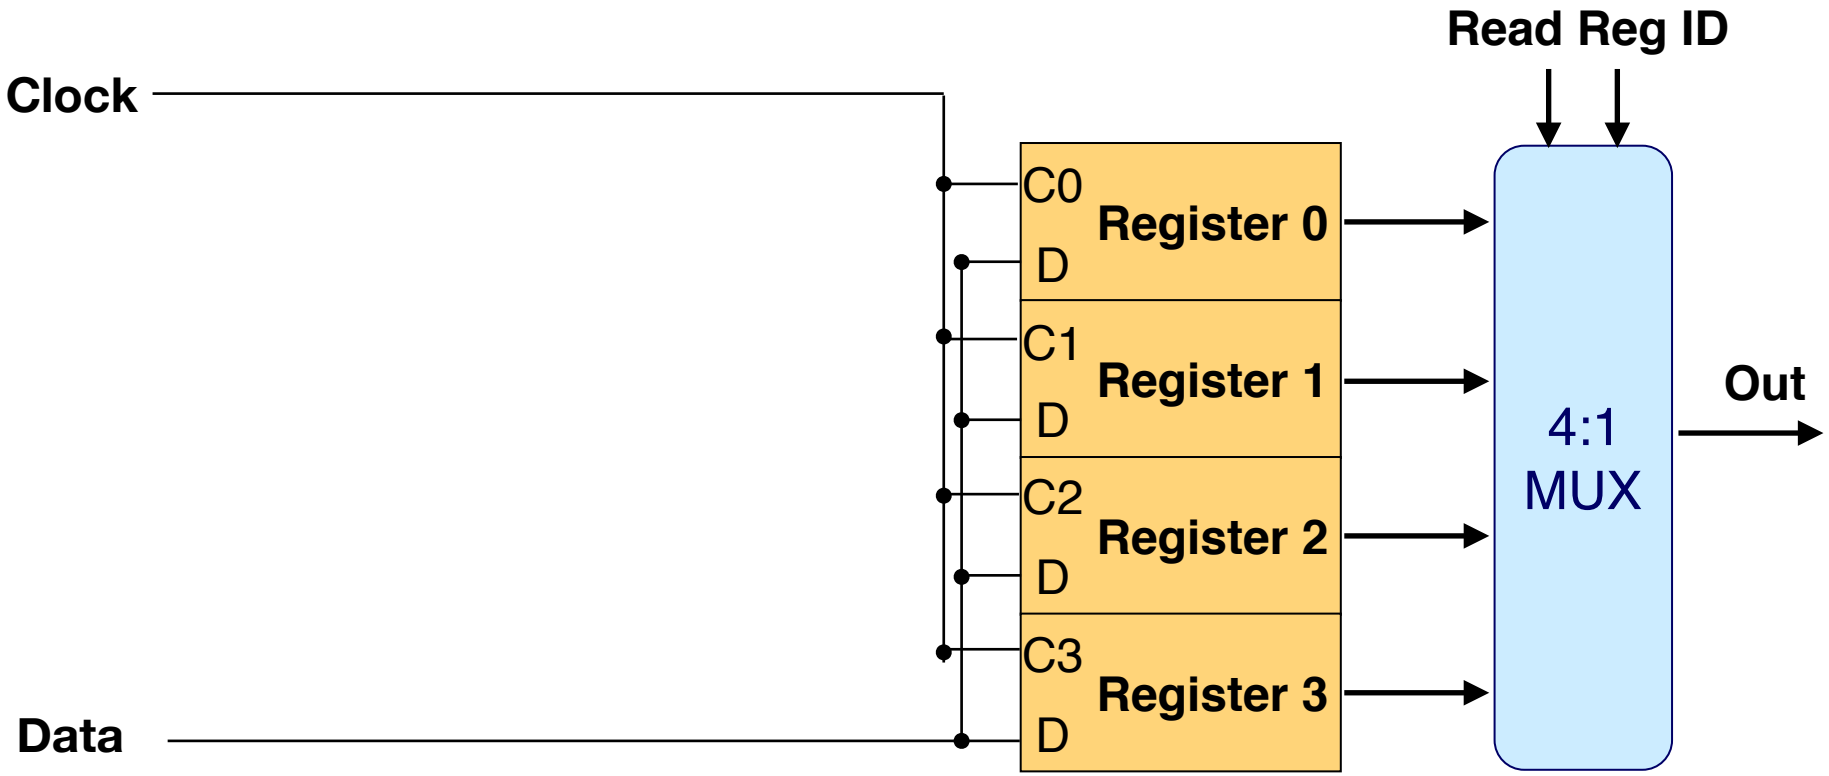
Register File Write



Register File Write

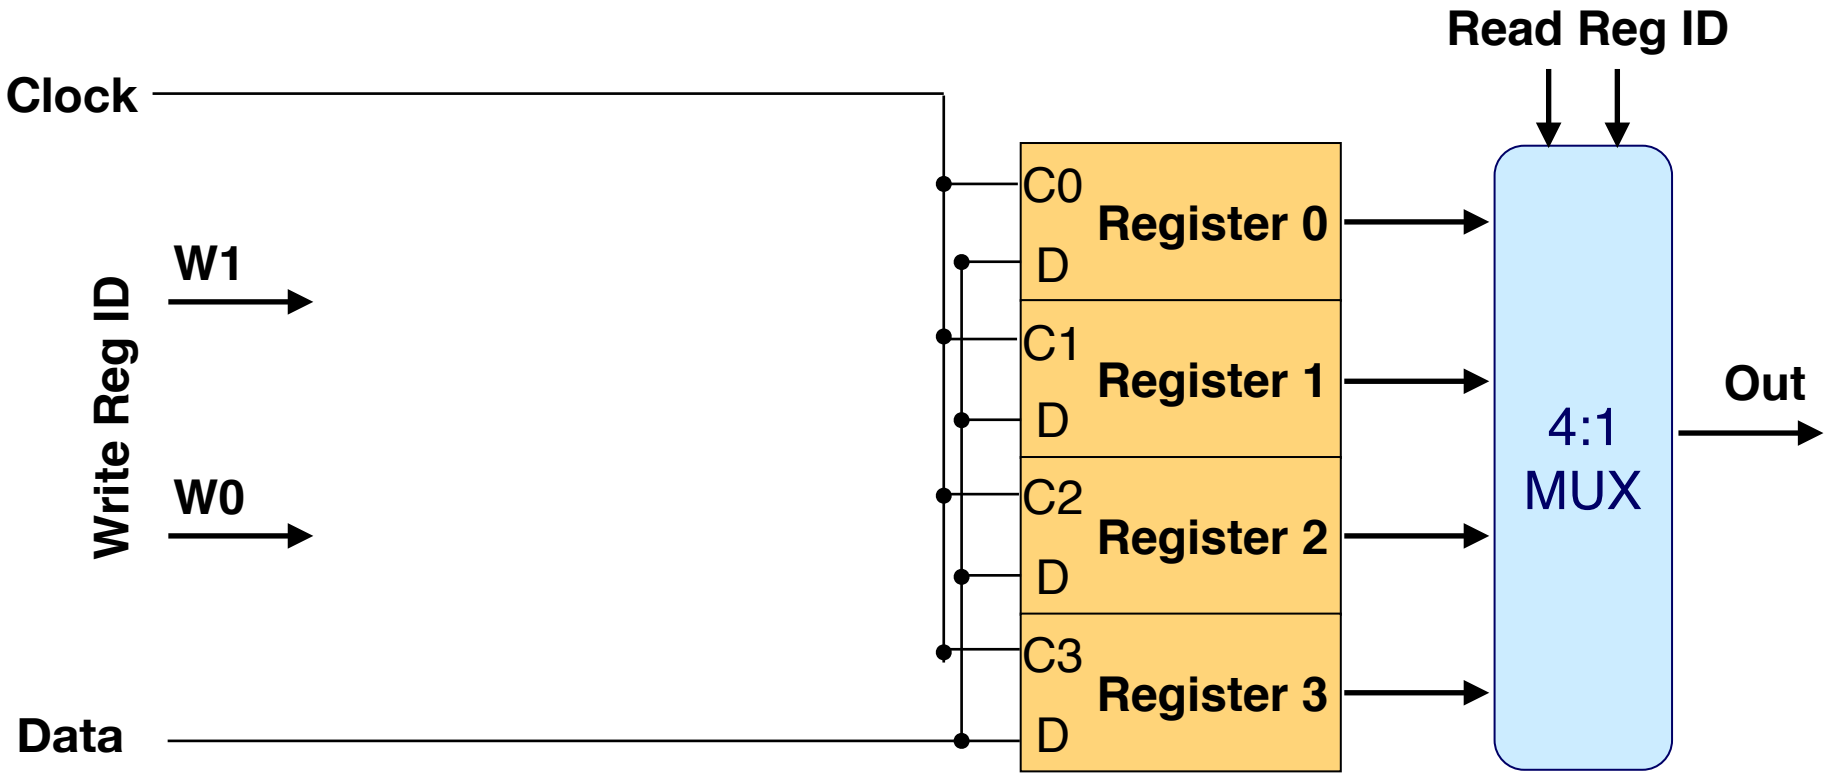


Register File Write



Register File Write

- Only write the a specific register when the clock rises. How??



Register File Write

- Only write the a specific register when the clock rises. How??

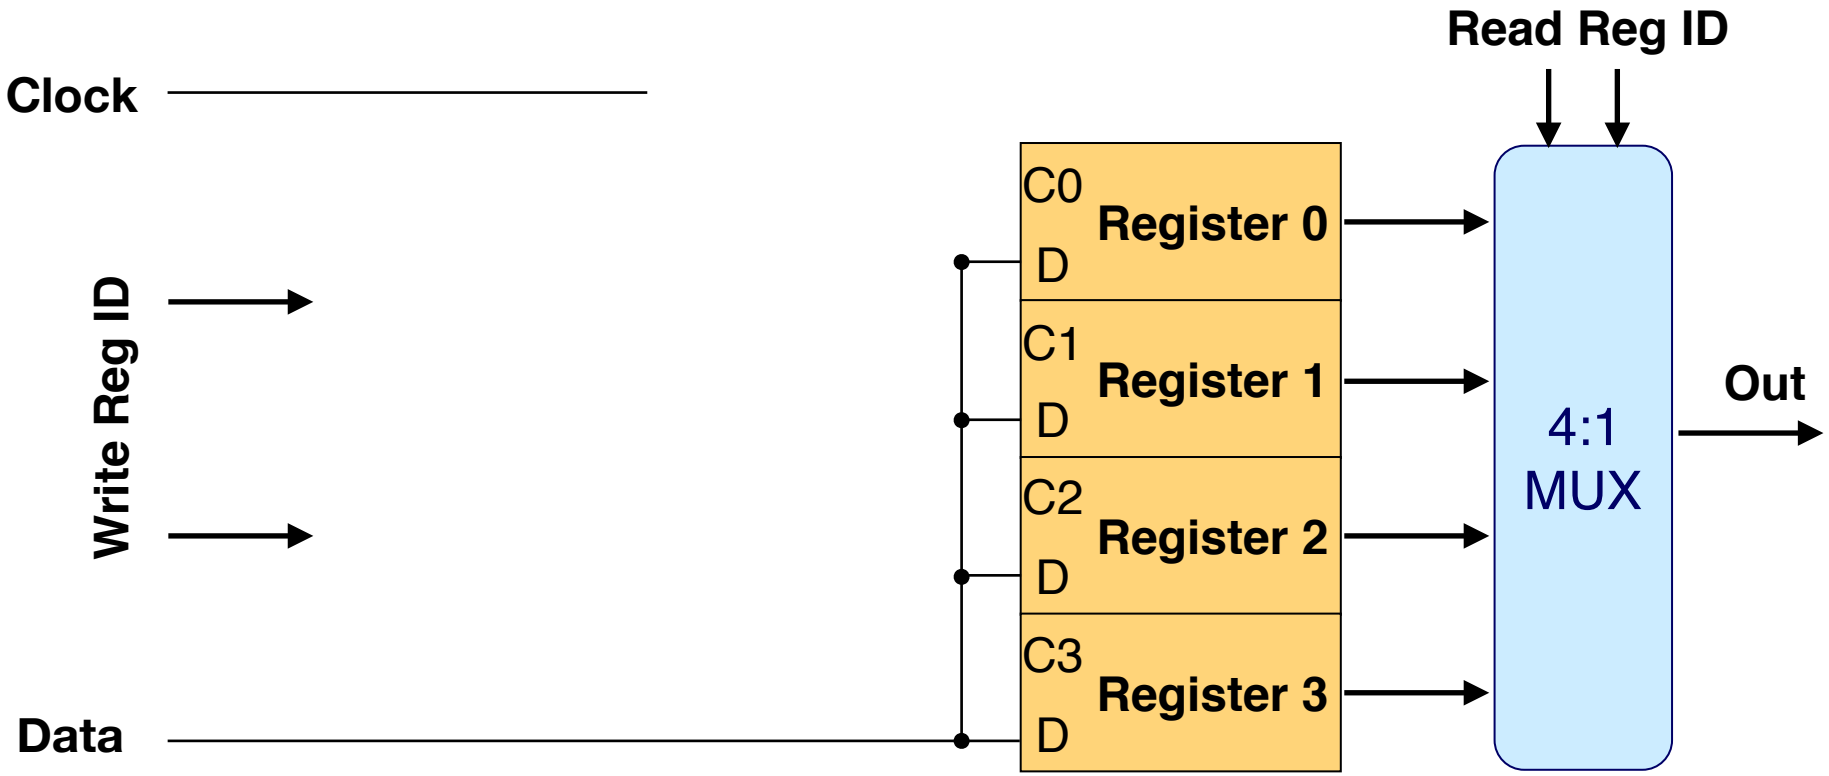
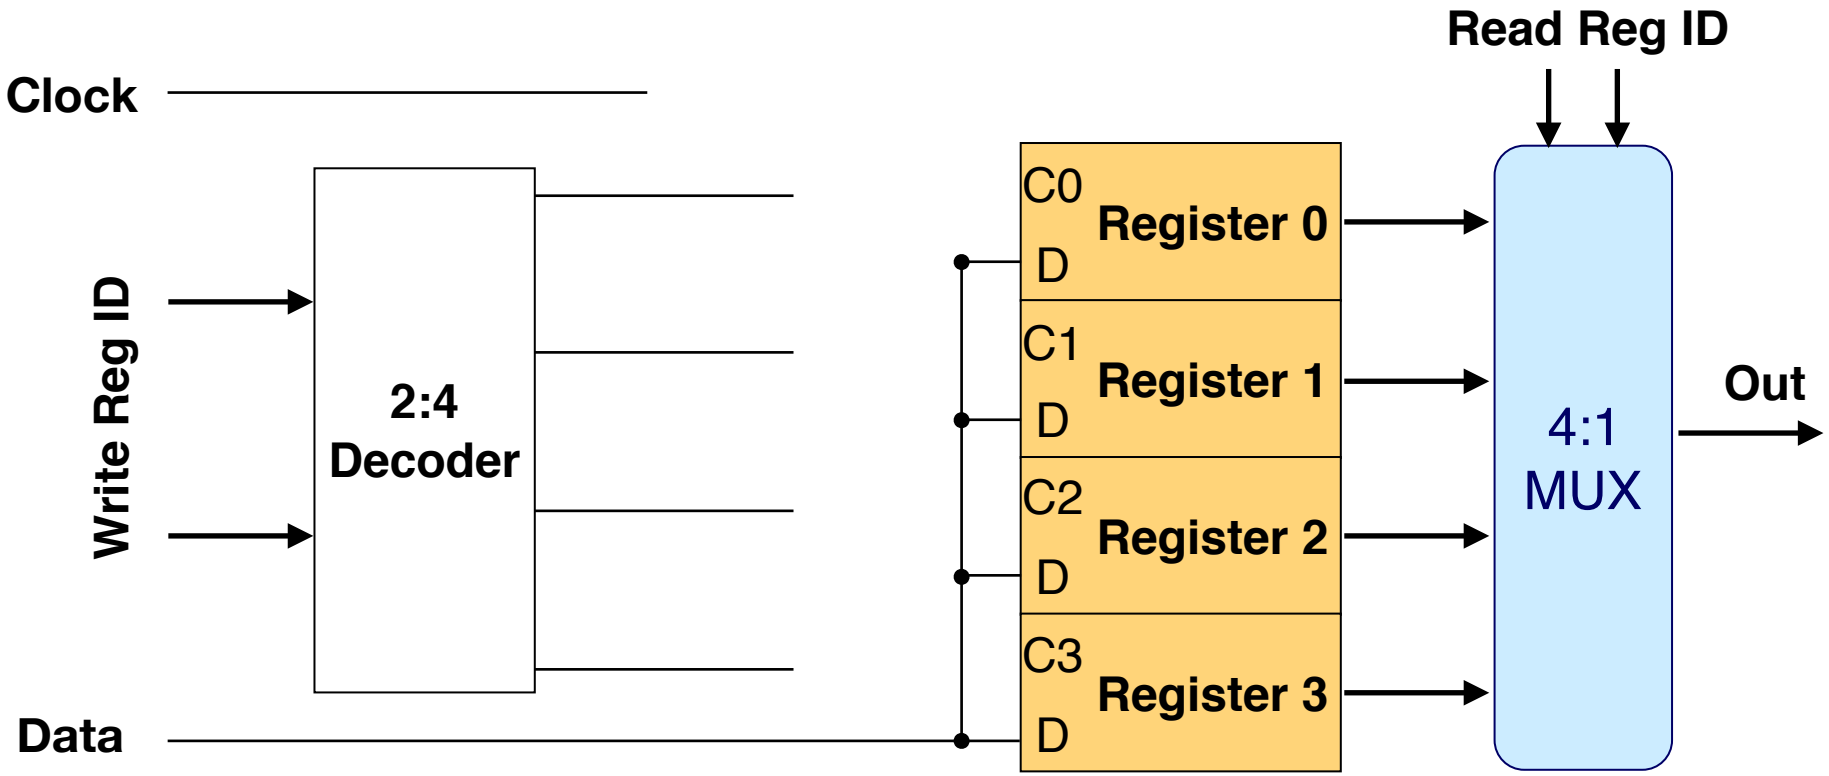
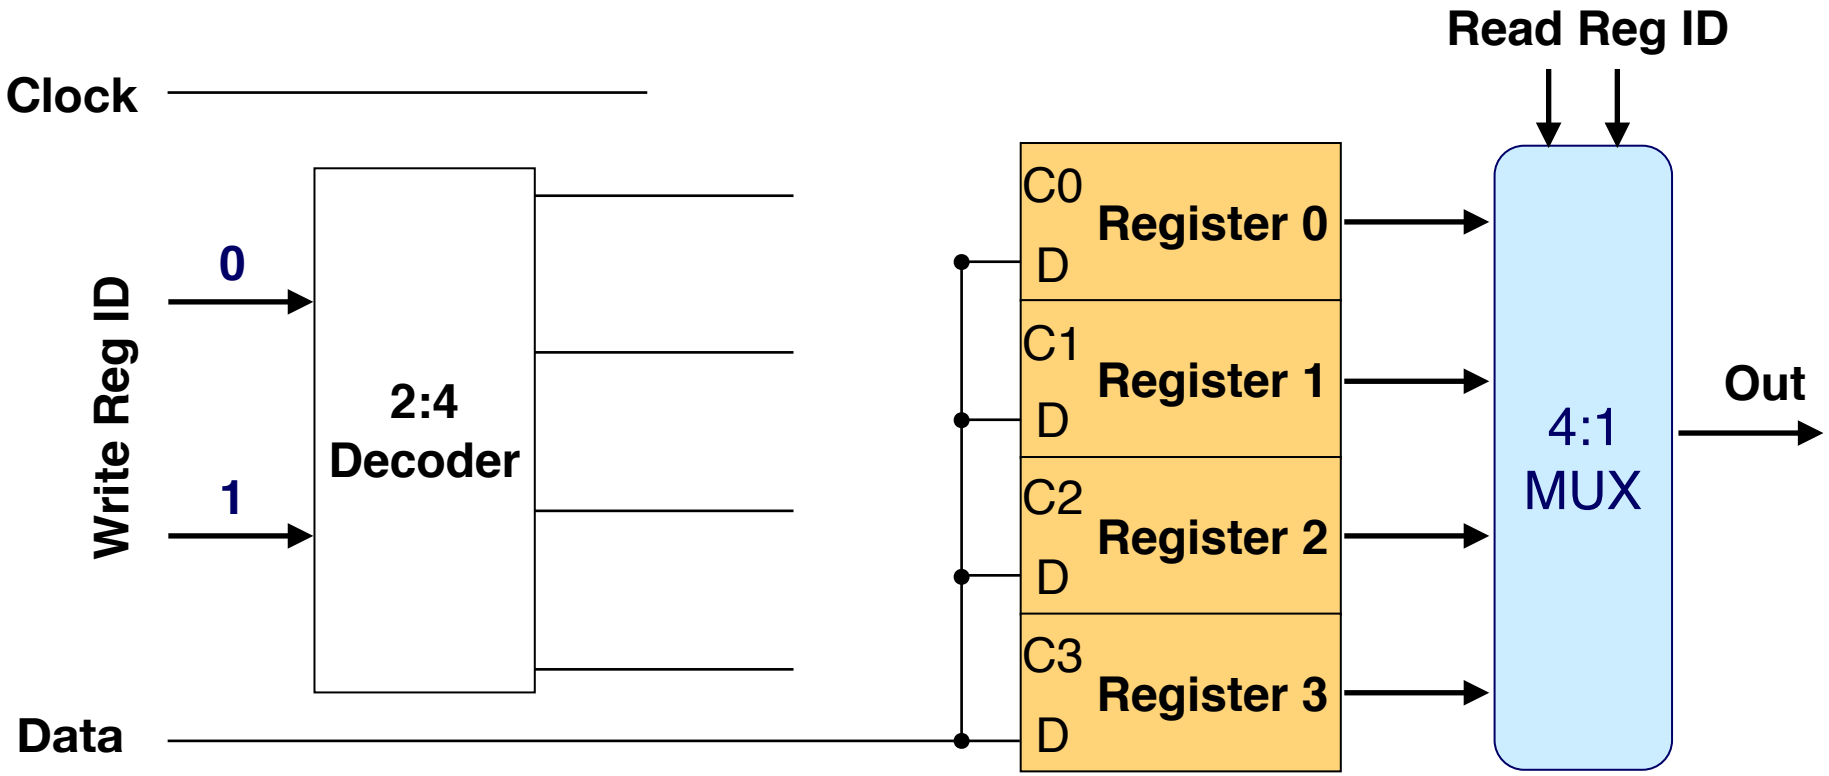
Register File Write



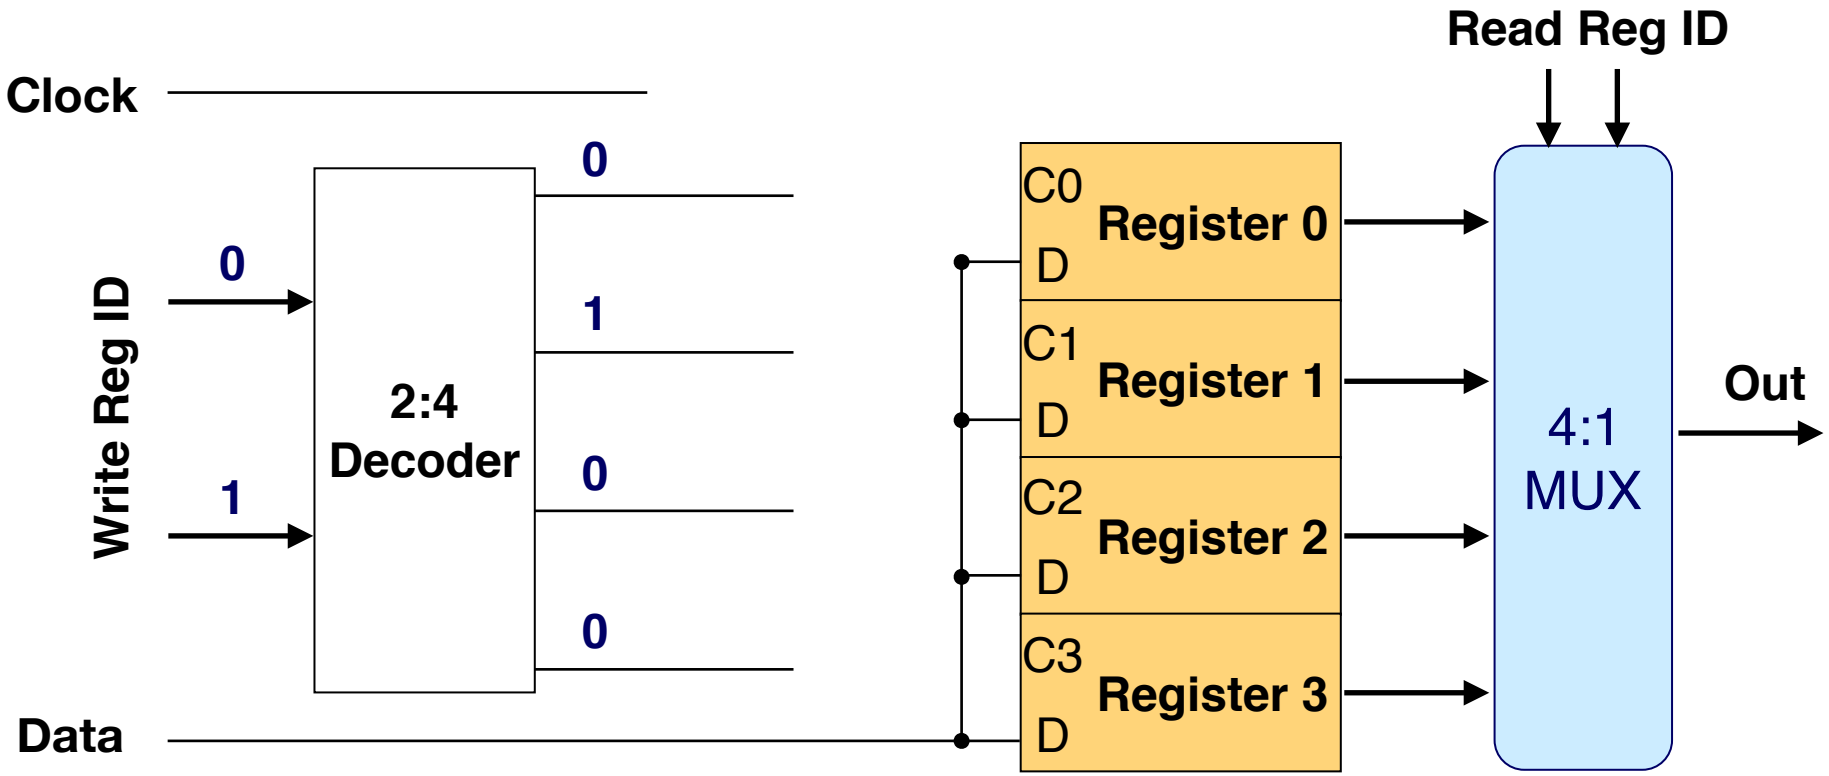
Register File Write



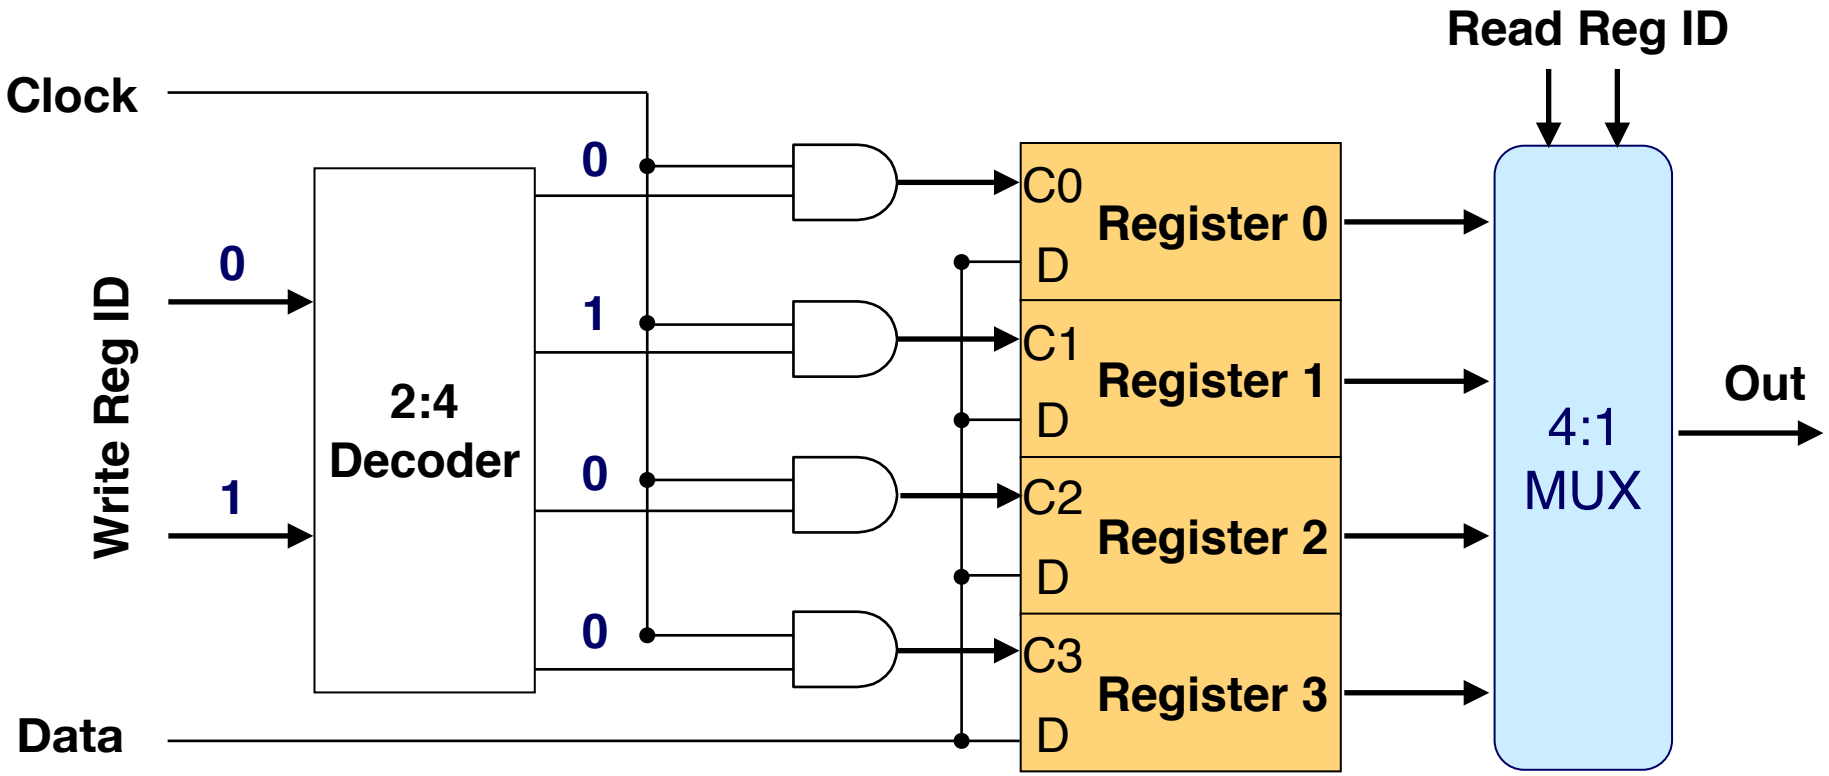
Register File Write



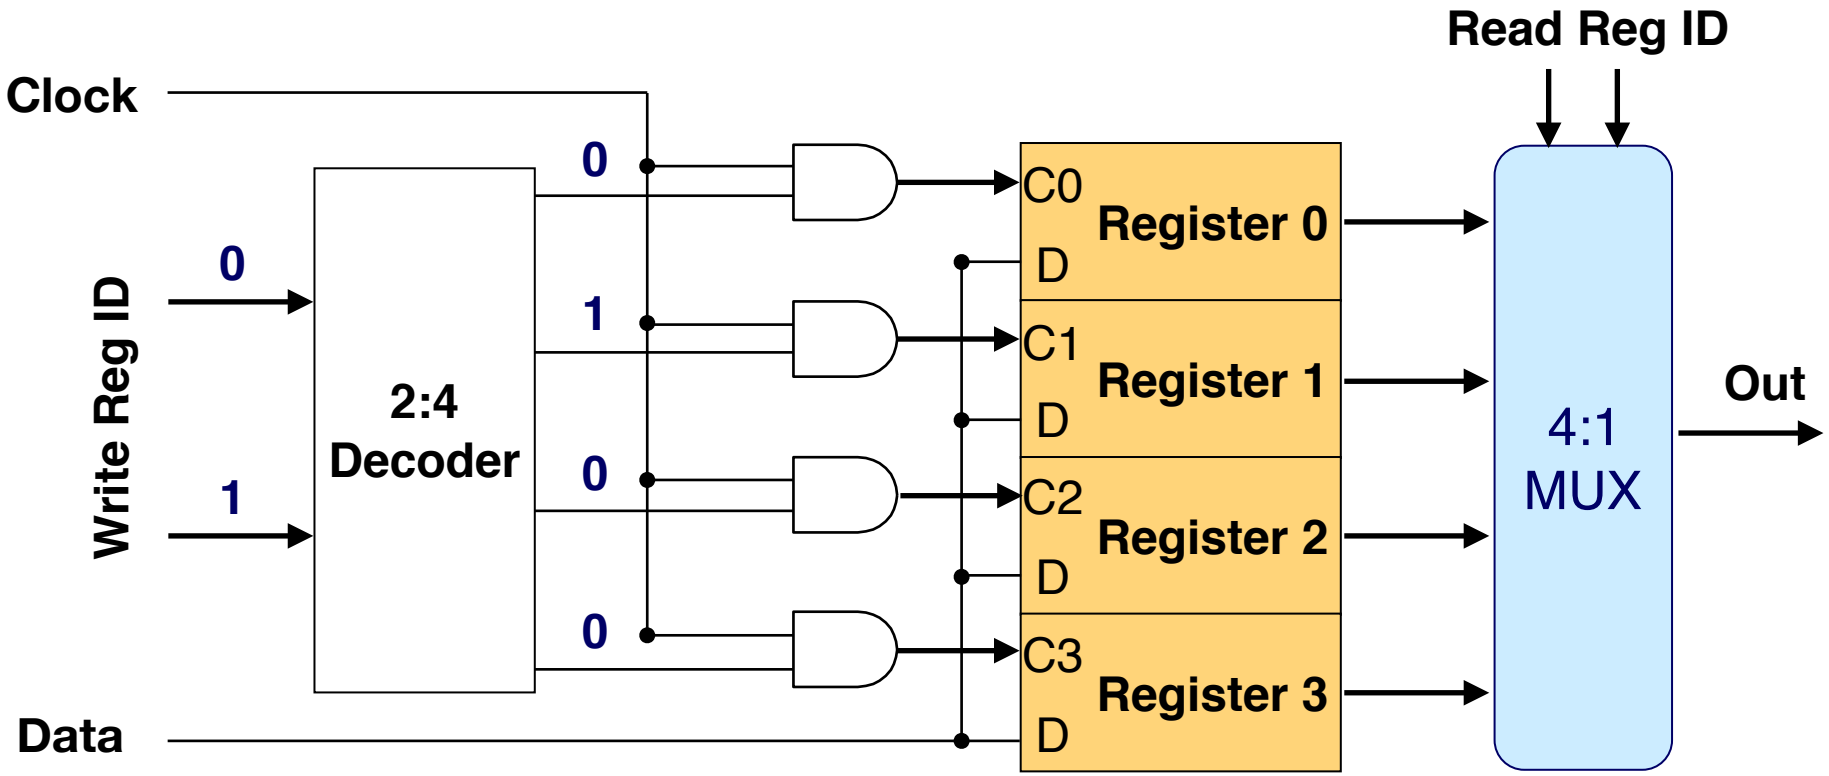
Register File Write



Register File Write



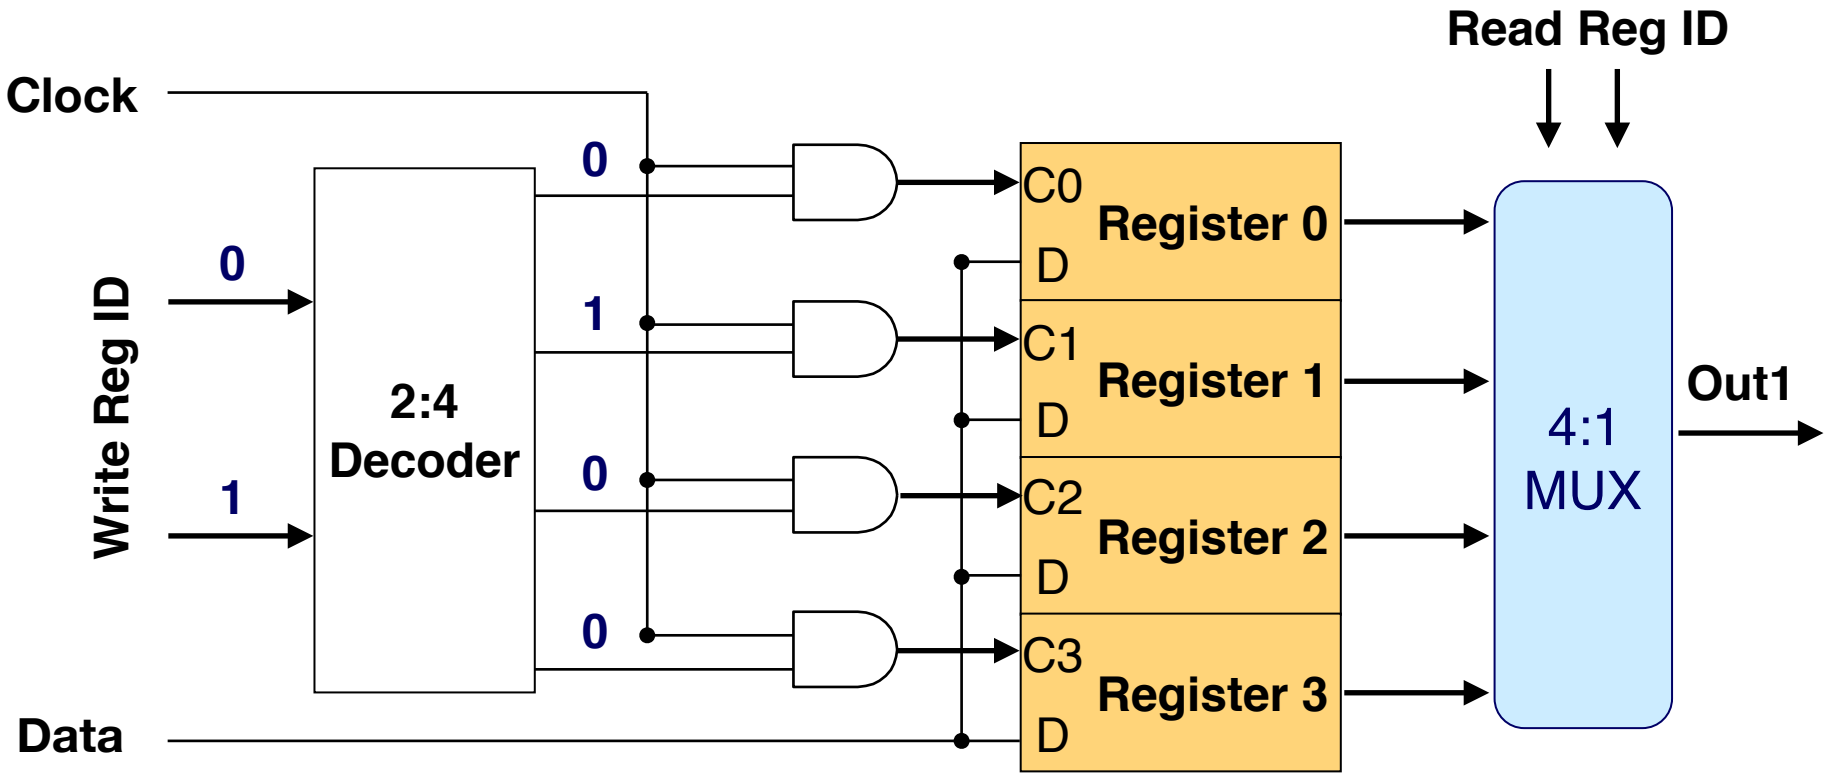
Register File Write



- This implementation can read 1 register and write 1 register at the same time: 1 read port and 1 write port

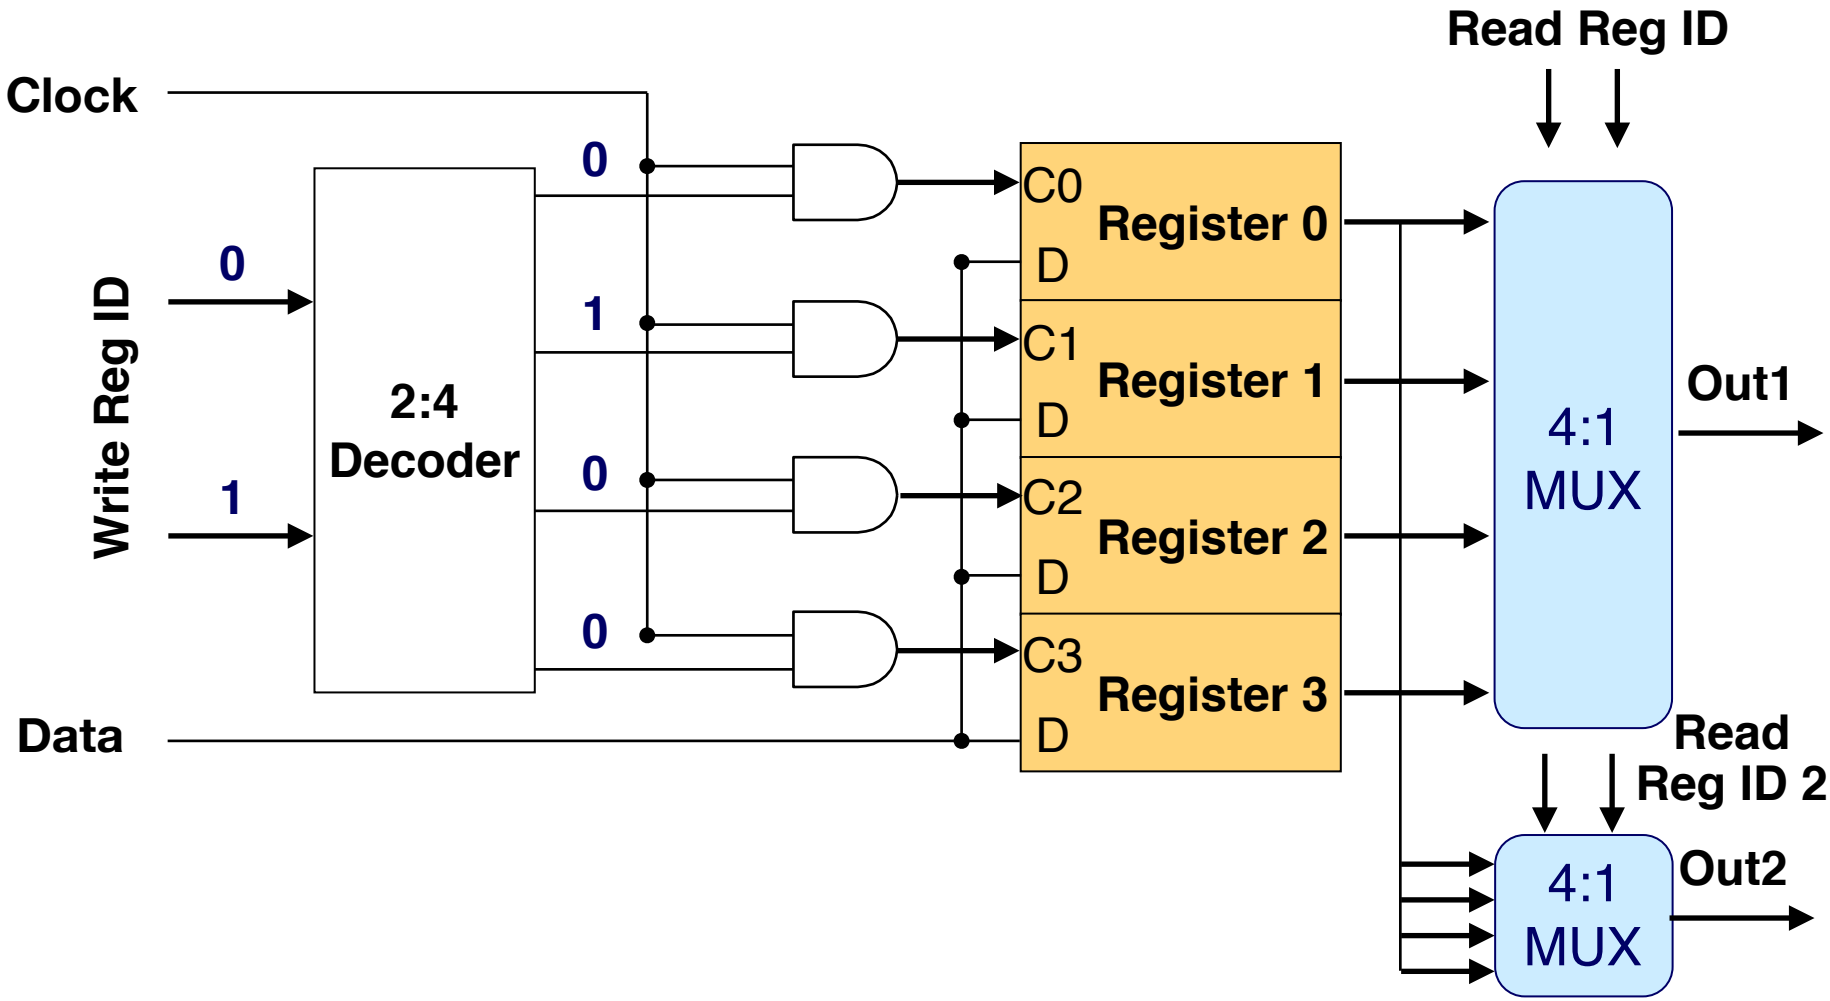
Multi-Port Register File

- What if we want to read multiple registers at the same time?



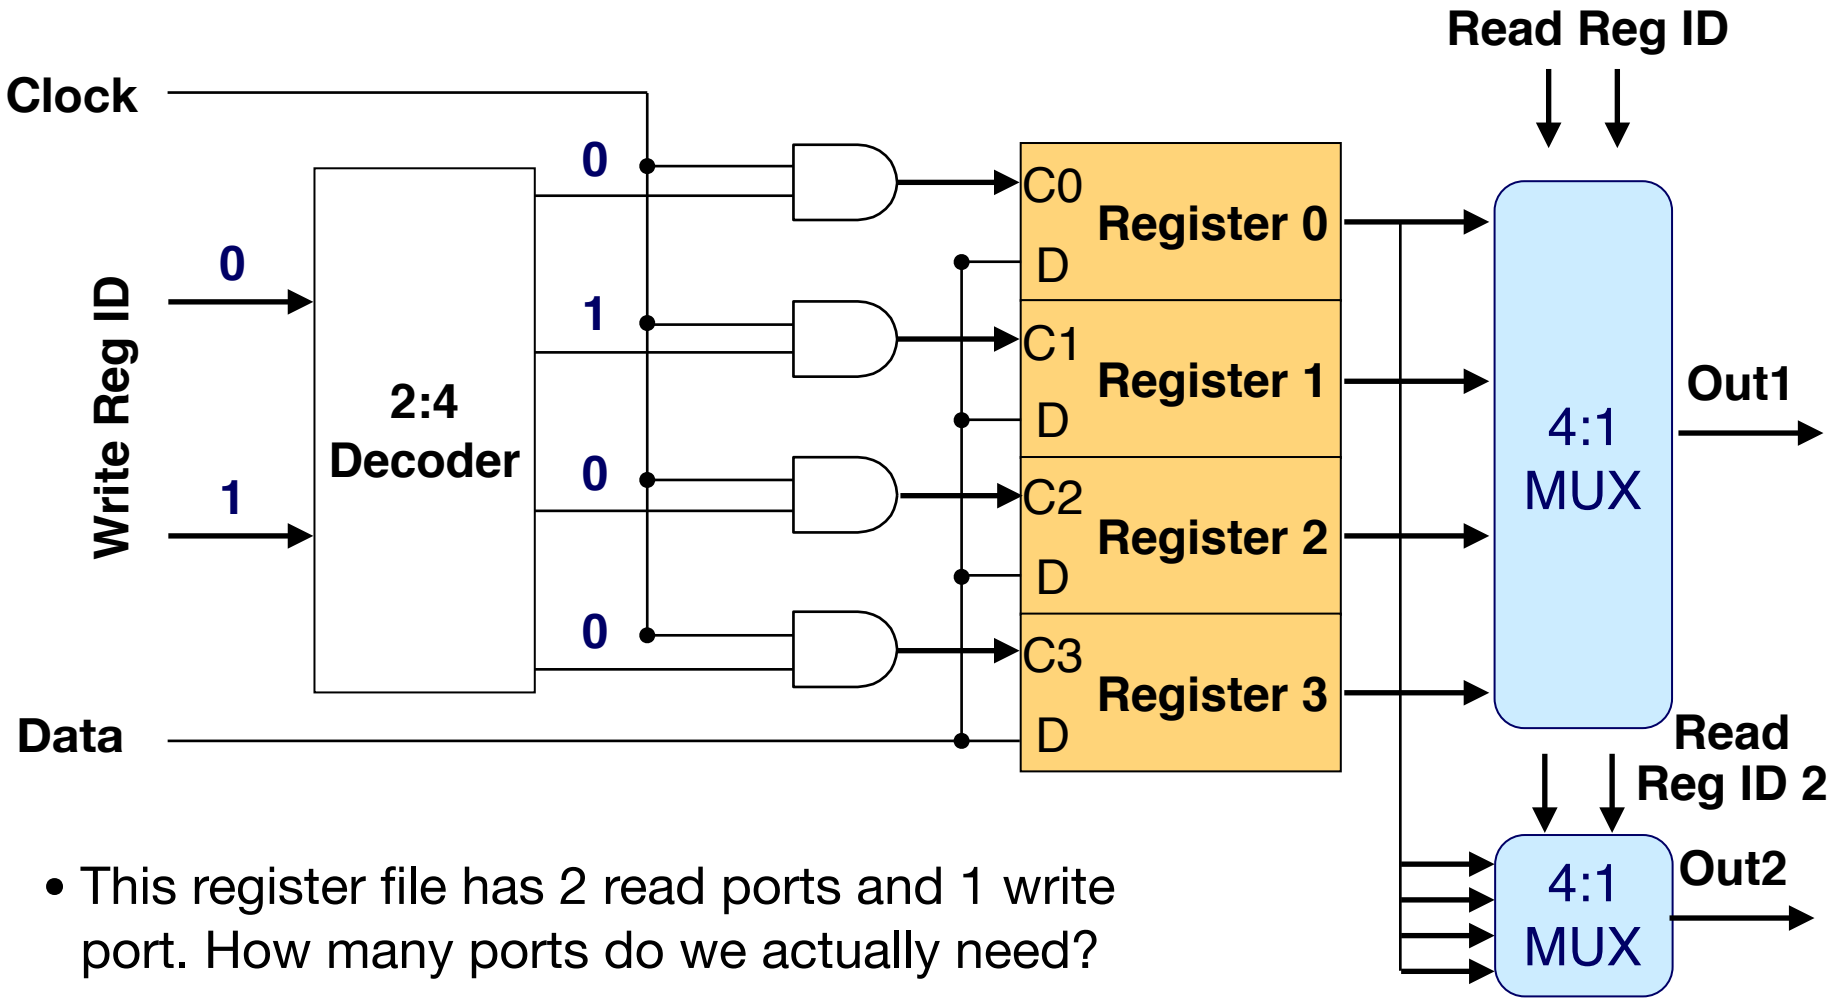
Multi-Port Register File

- What if we want to read multiple registers at the same time?



Multi-Port Register File

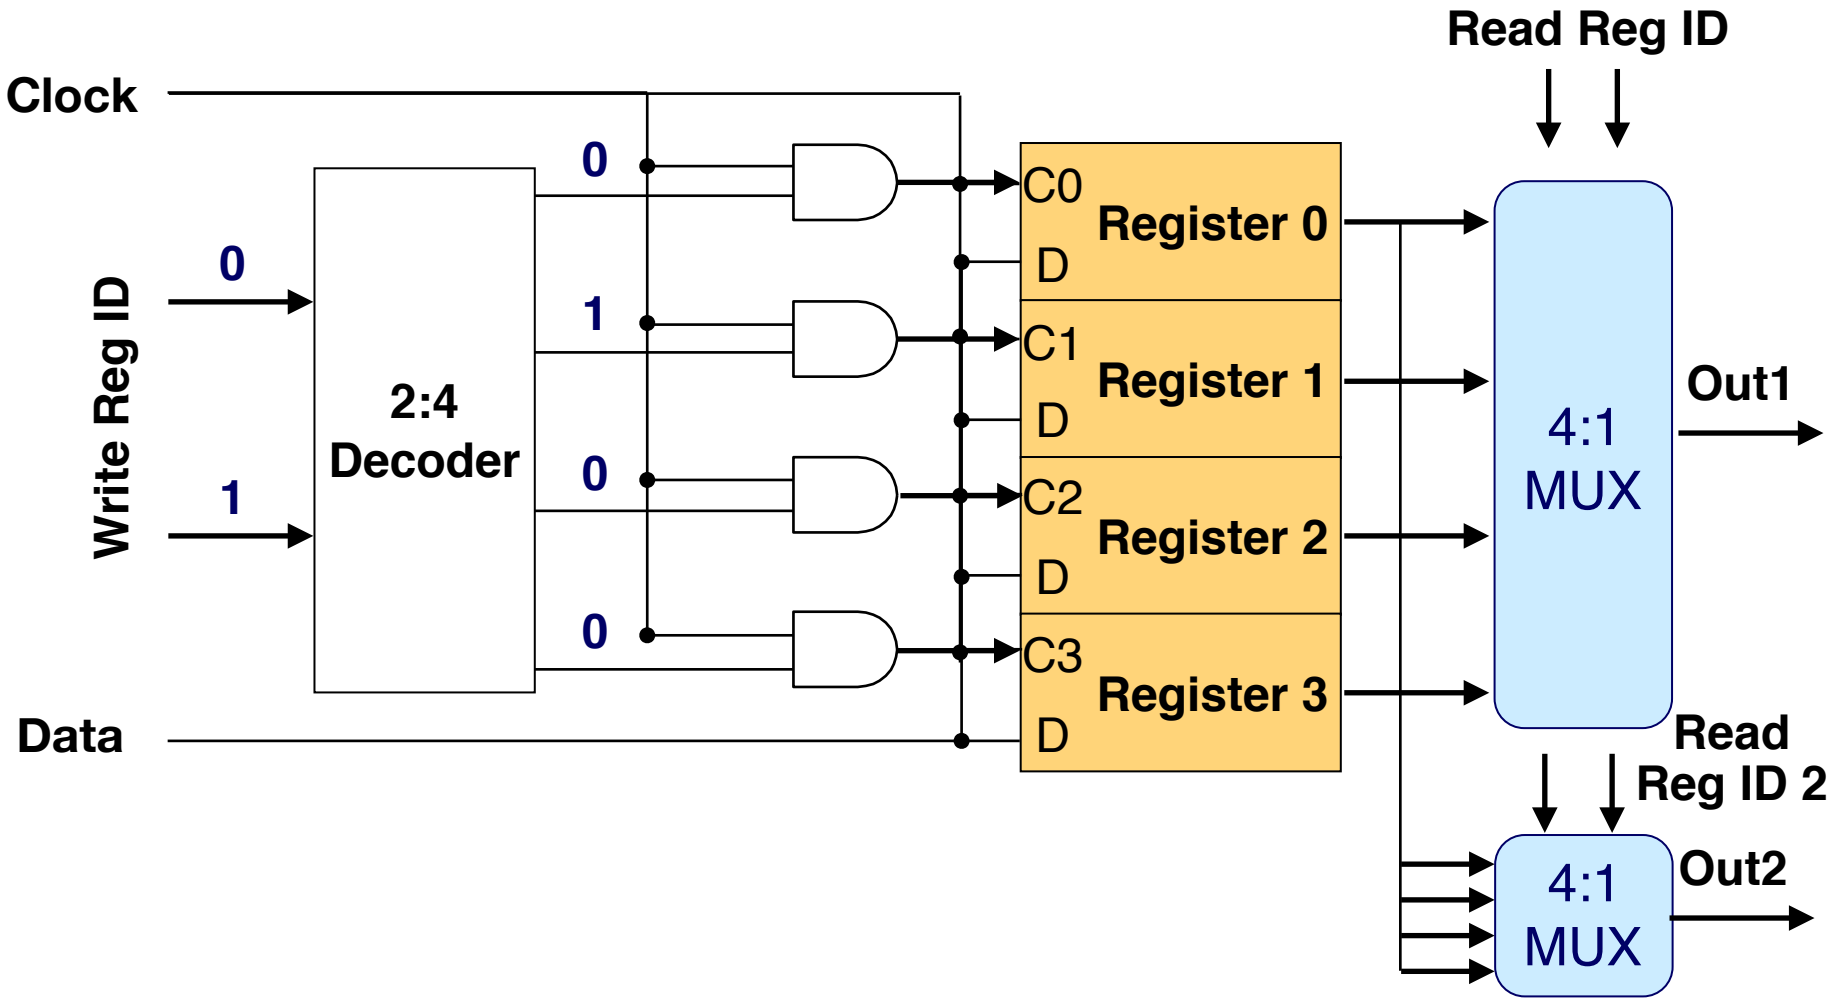
- What if we want to read multiple registers at the same time?



- This register file has 2 read ports and 1 write port. How many ports do we actually need?

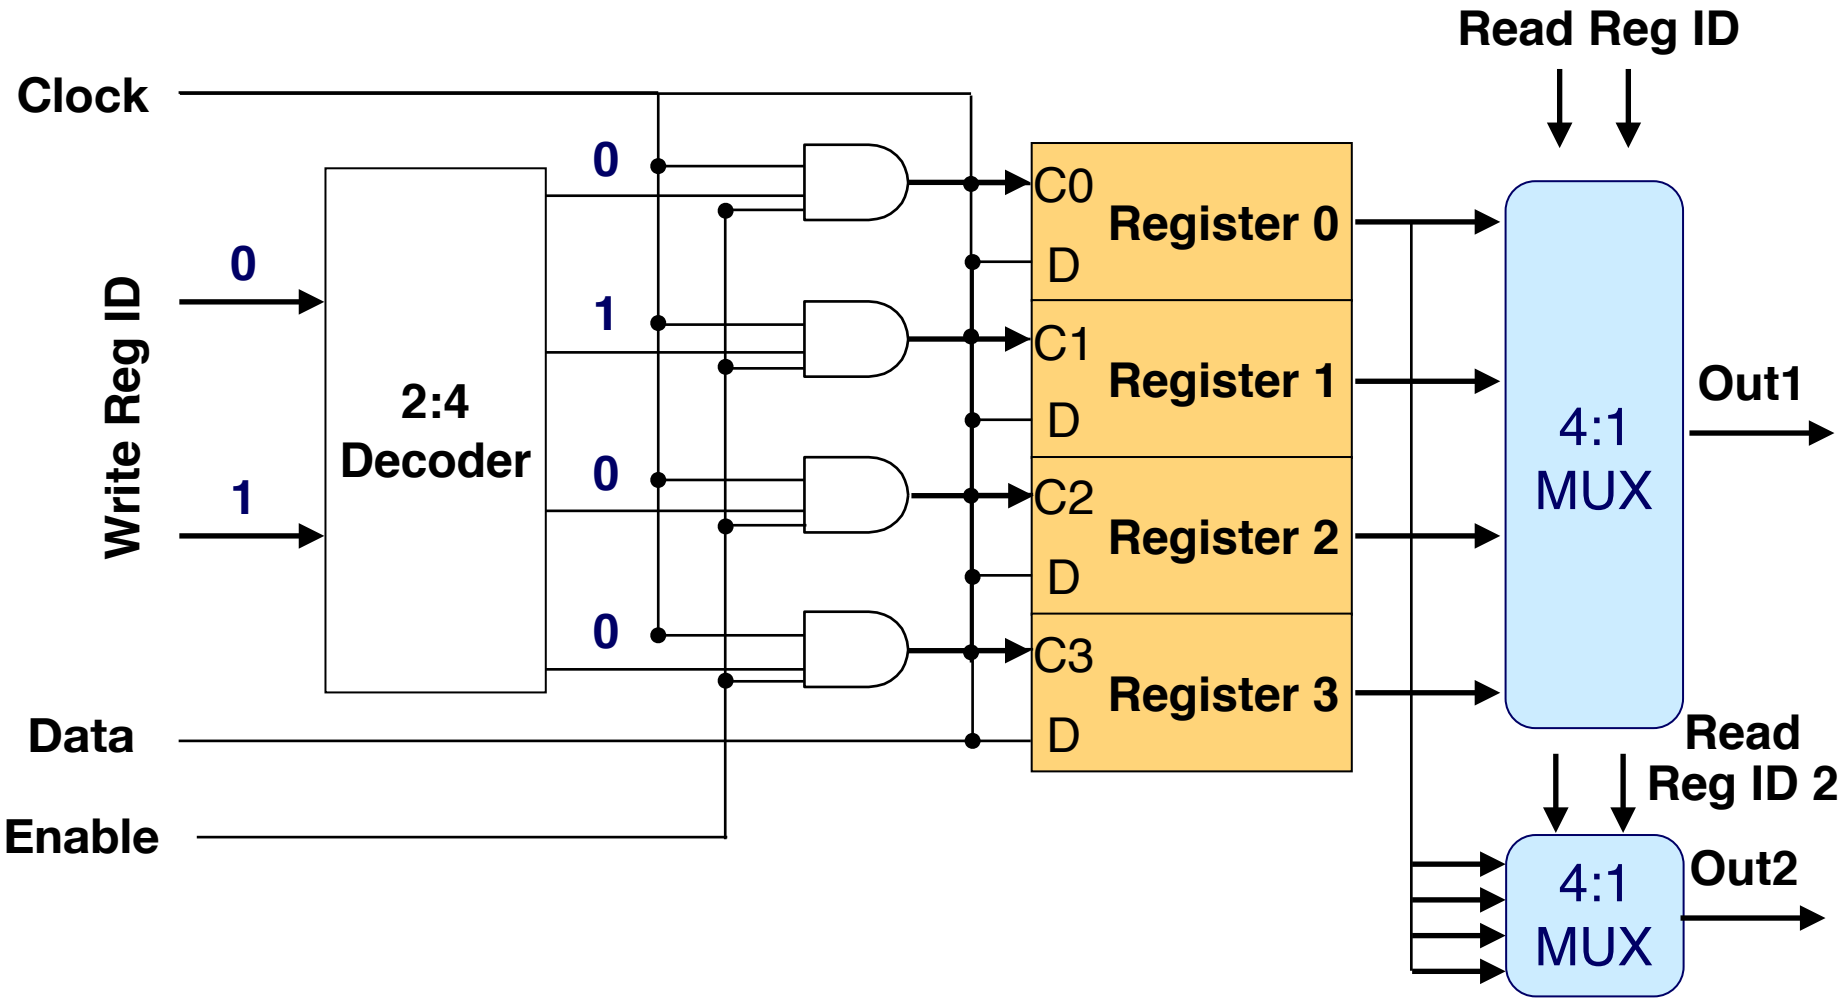
Multi-Port Register File

- Is this correct? What if we don't want to write anything?



Multi-Port Register File

- Is this correct? What if we don't want to write anything?

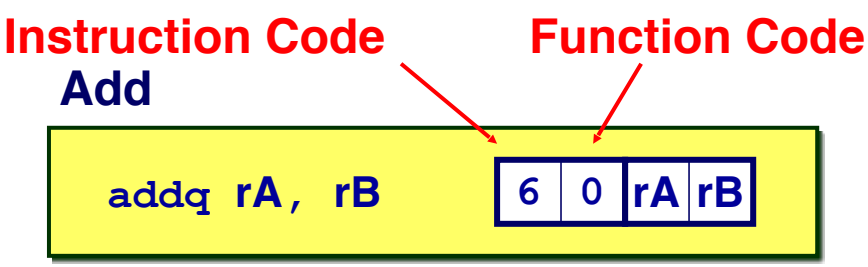


Processor Microarchitecture

- Sequential, single-cycle microarchitecture implementation
  - Basic idea
  - Hardware implementation
- Pipelined microarchitecture implementation
  - Basic Principles
  - Difficulties: Control Dependency
  - Difficulties: Data Dependency

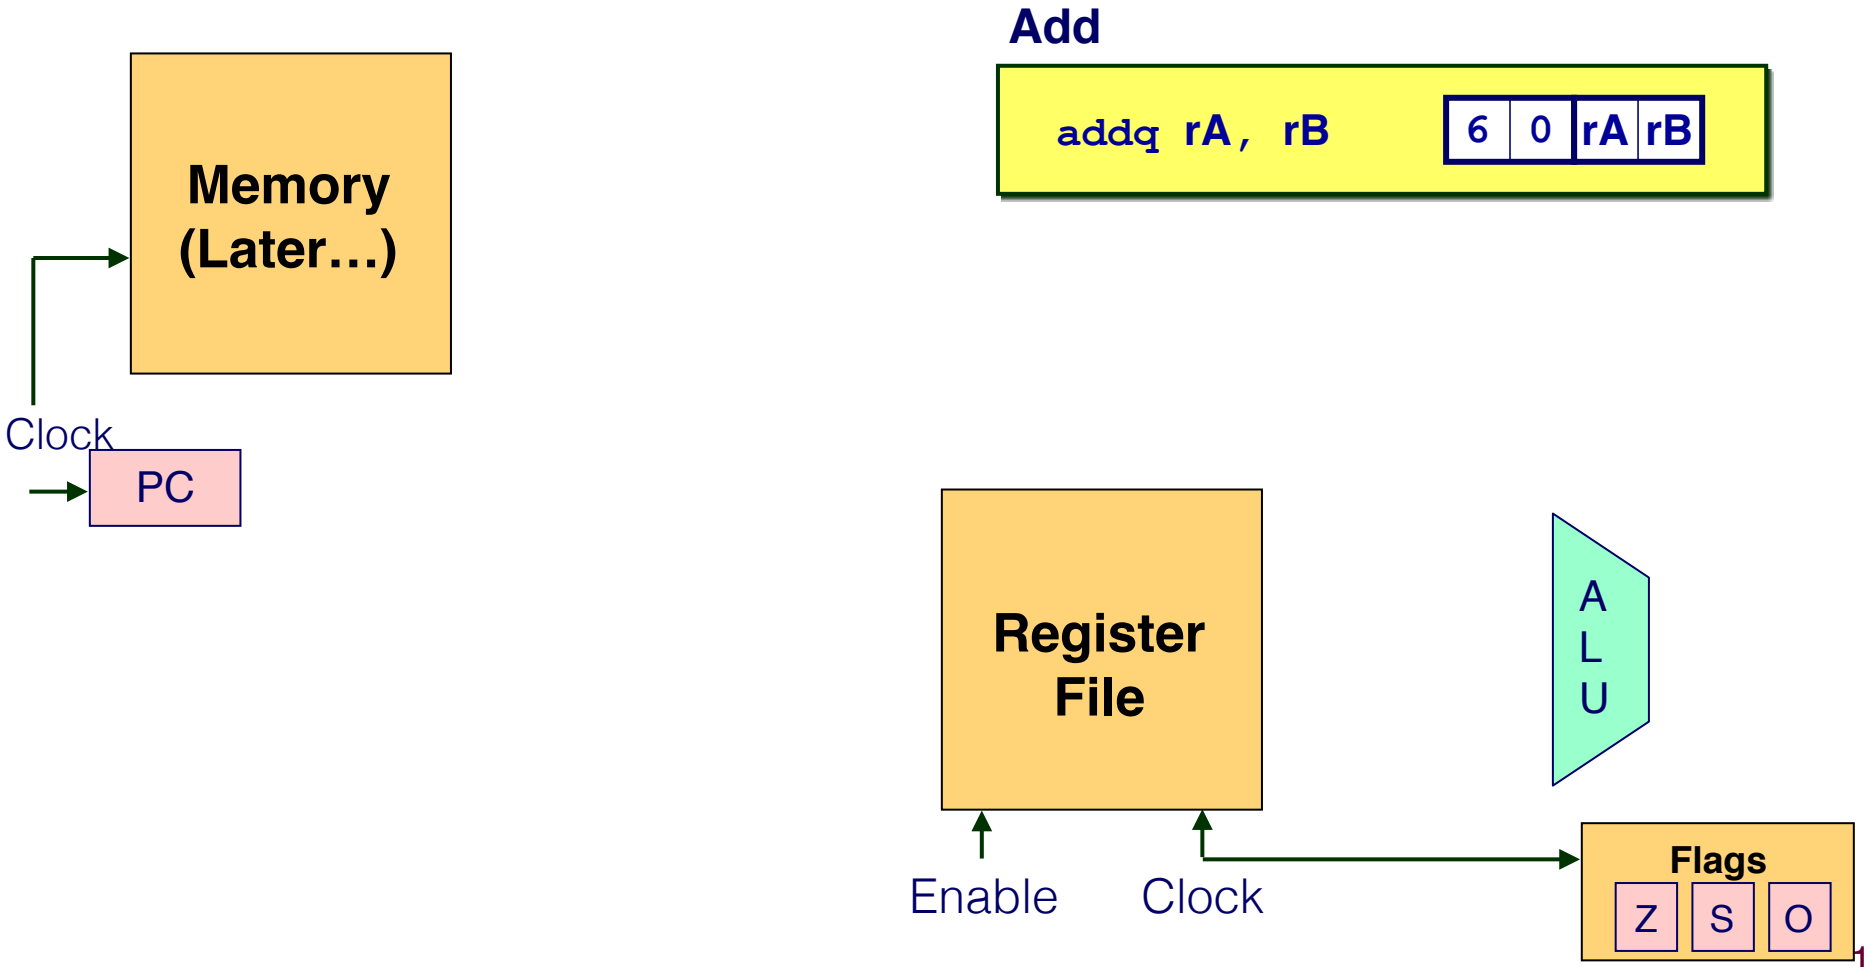
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



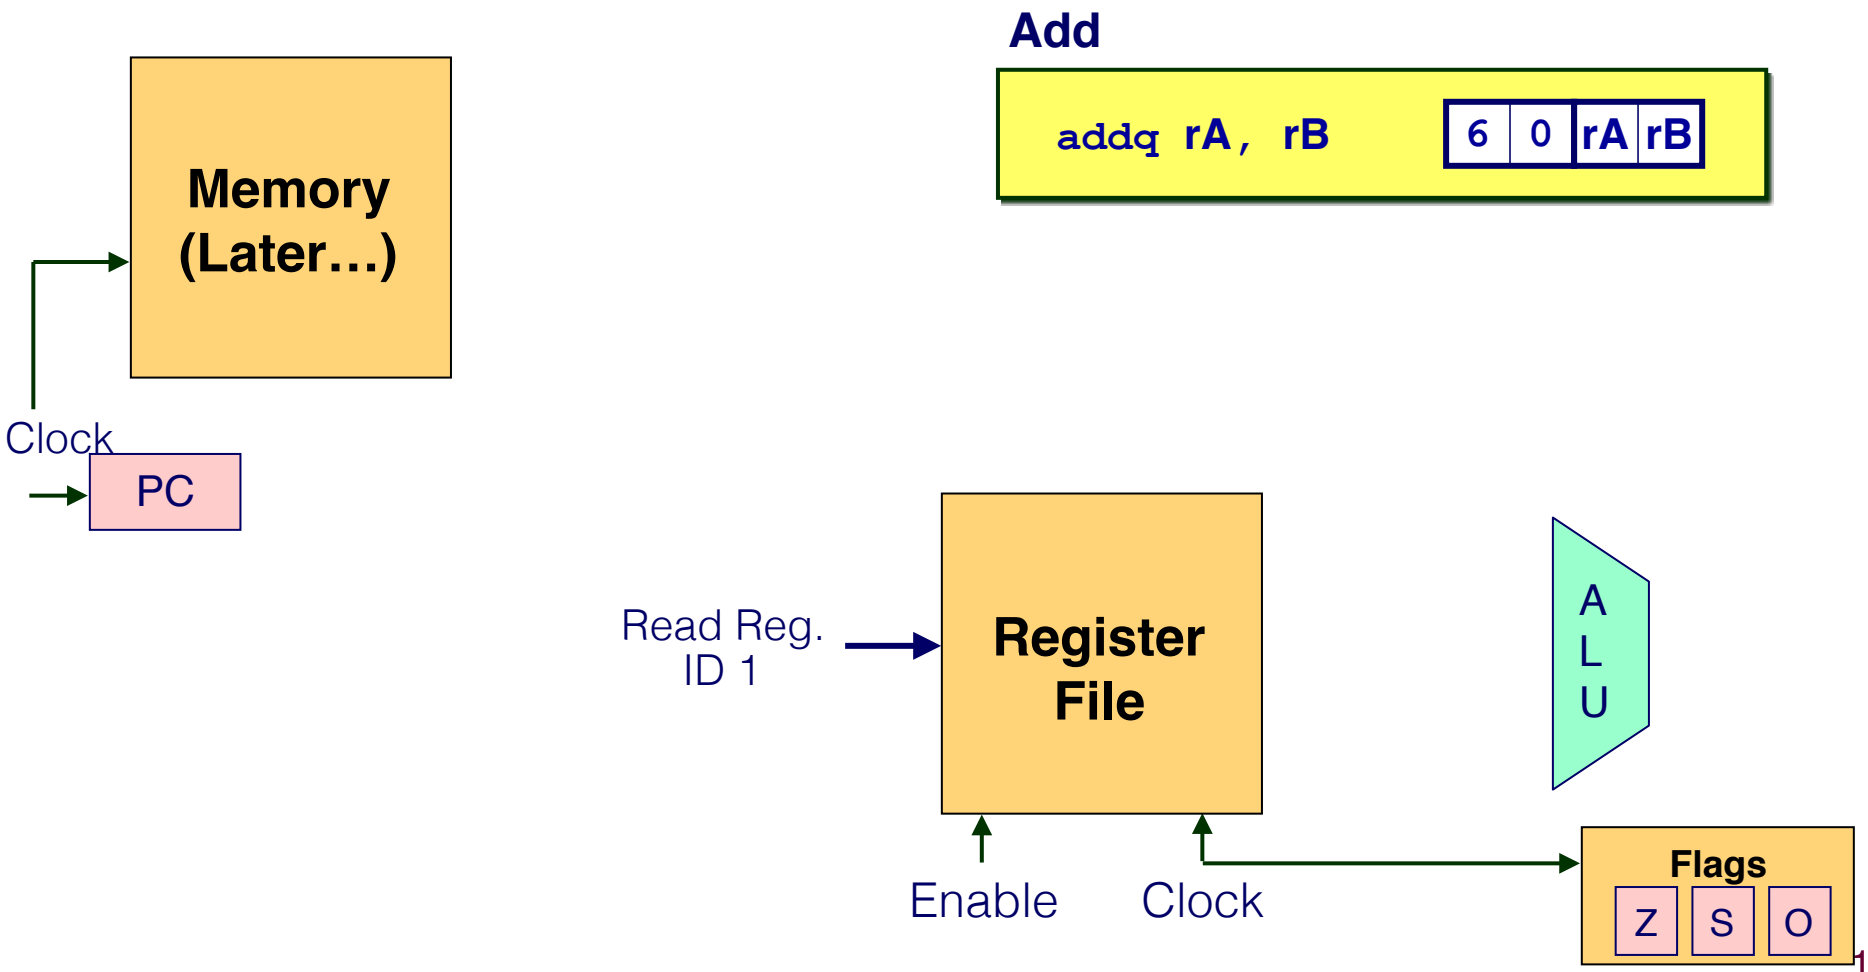
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



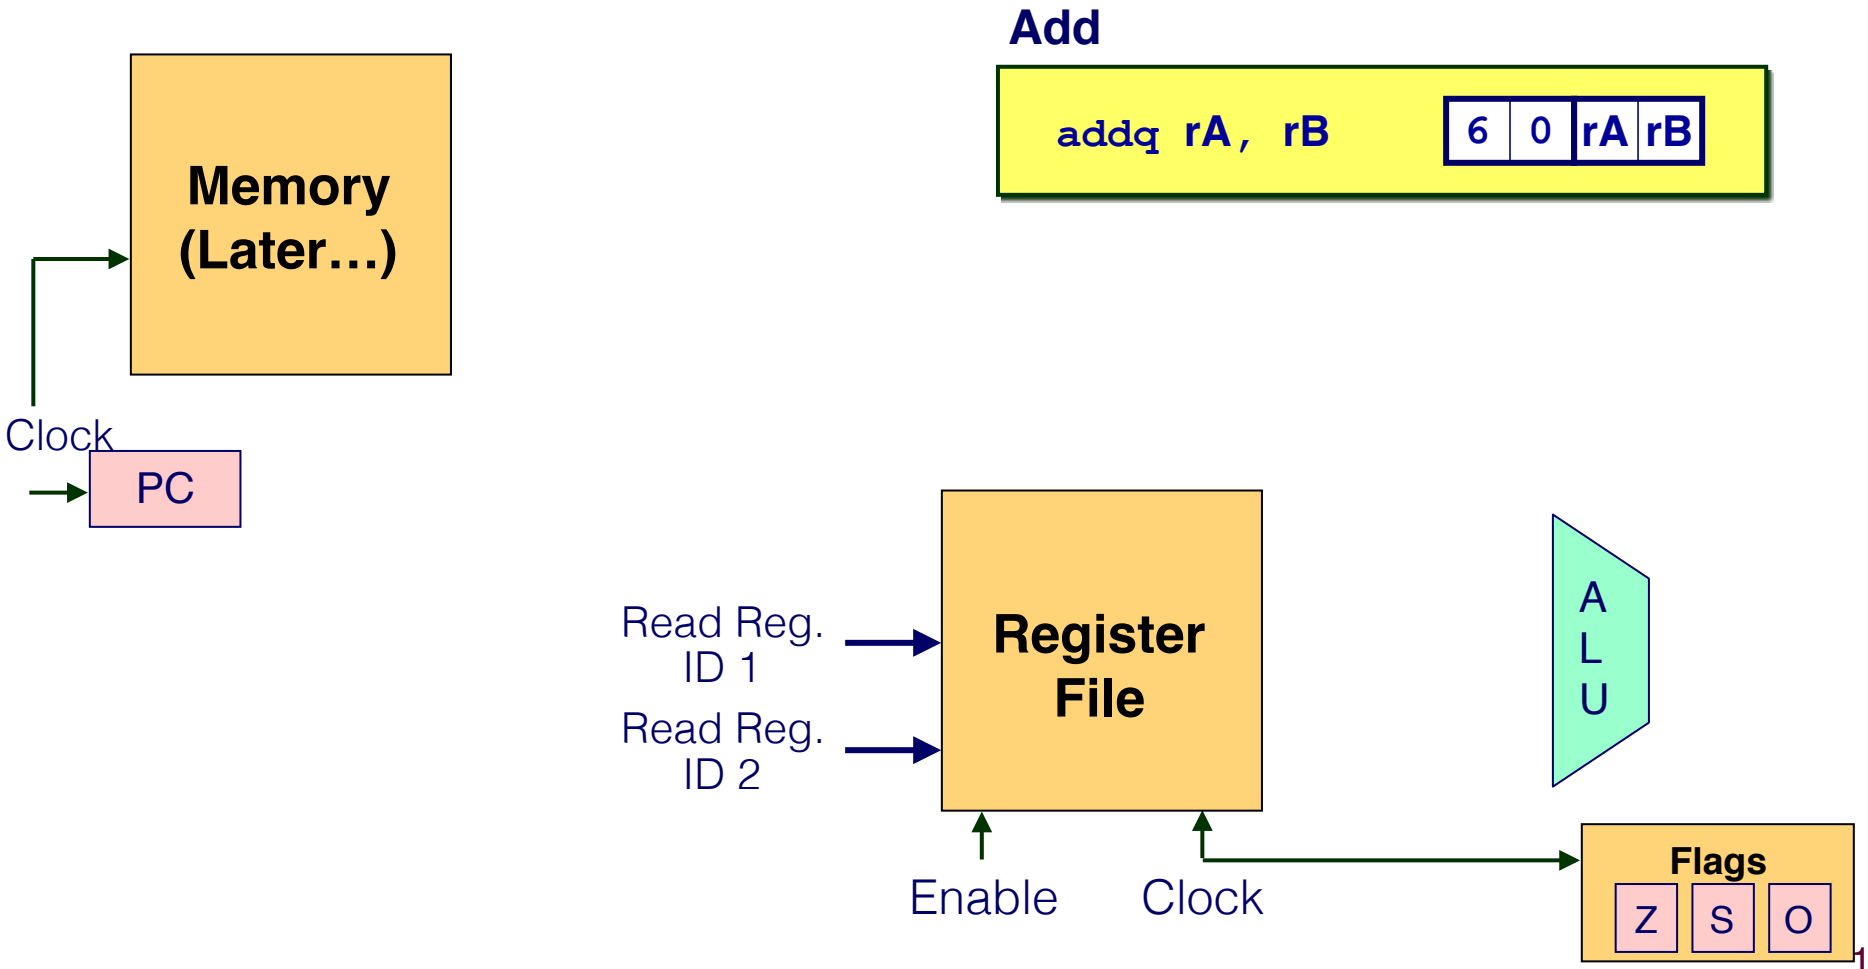
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



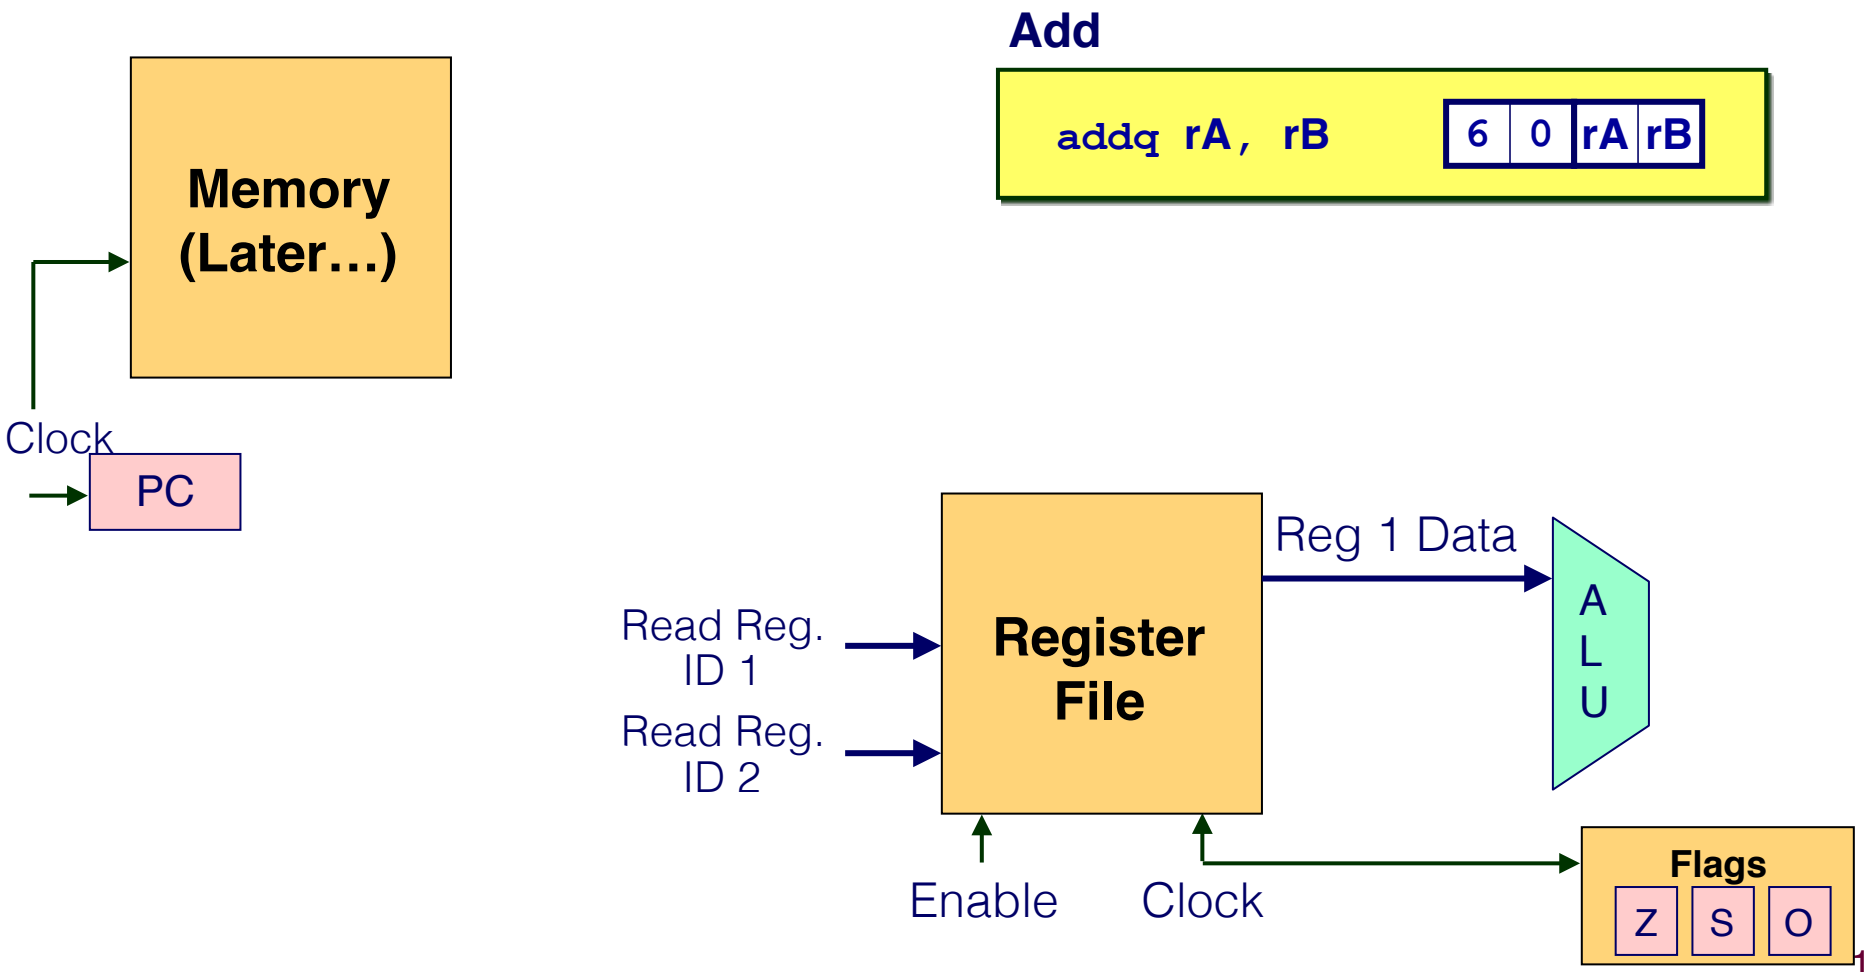
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



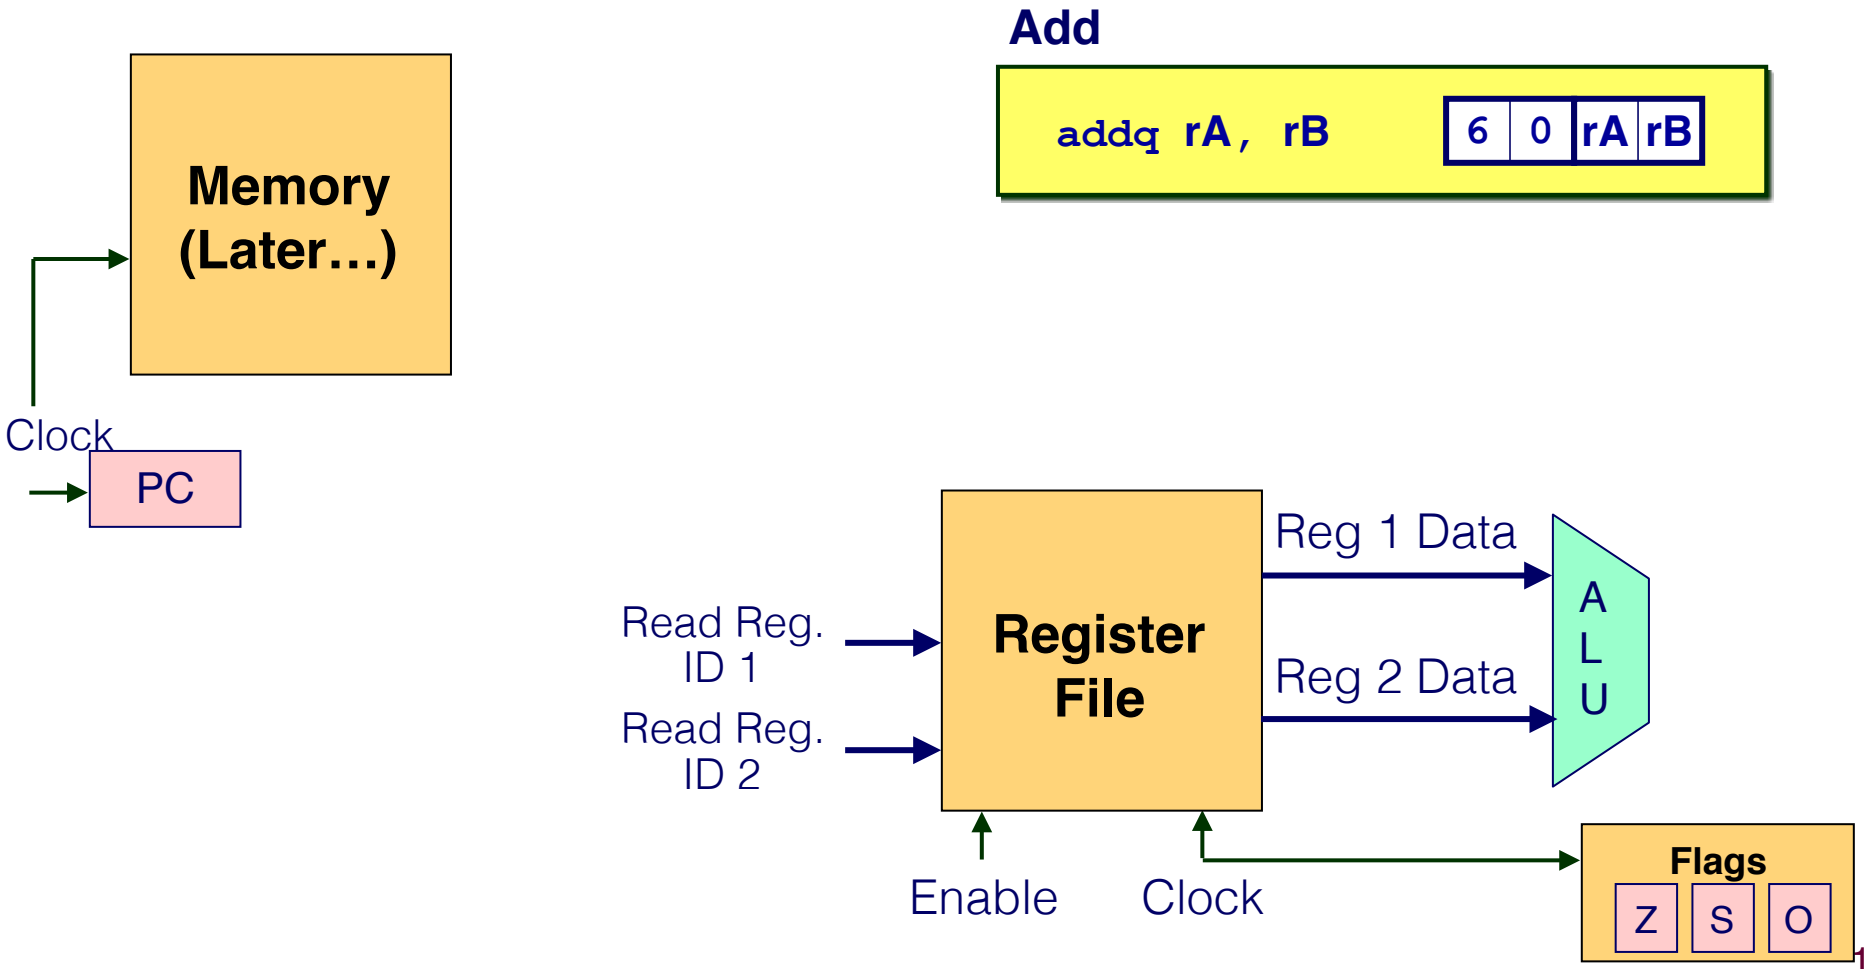
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



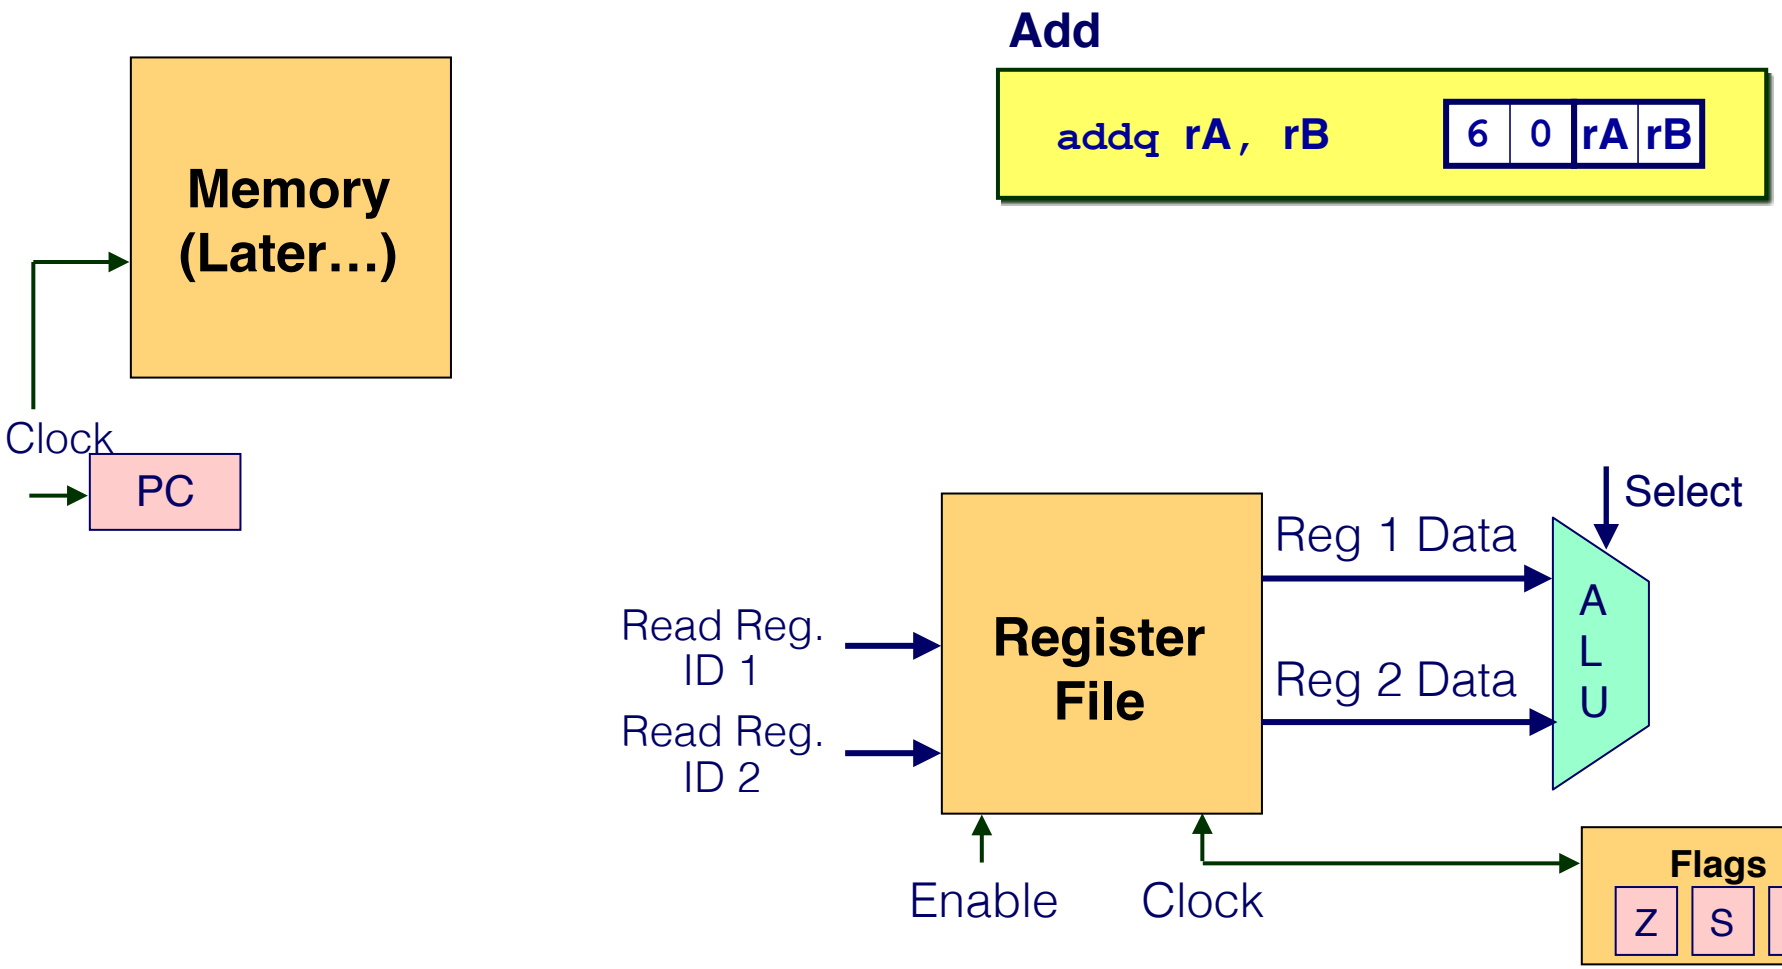
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



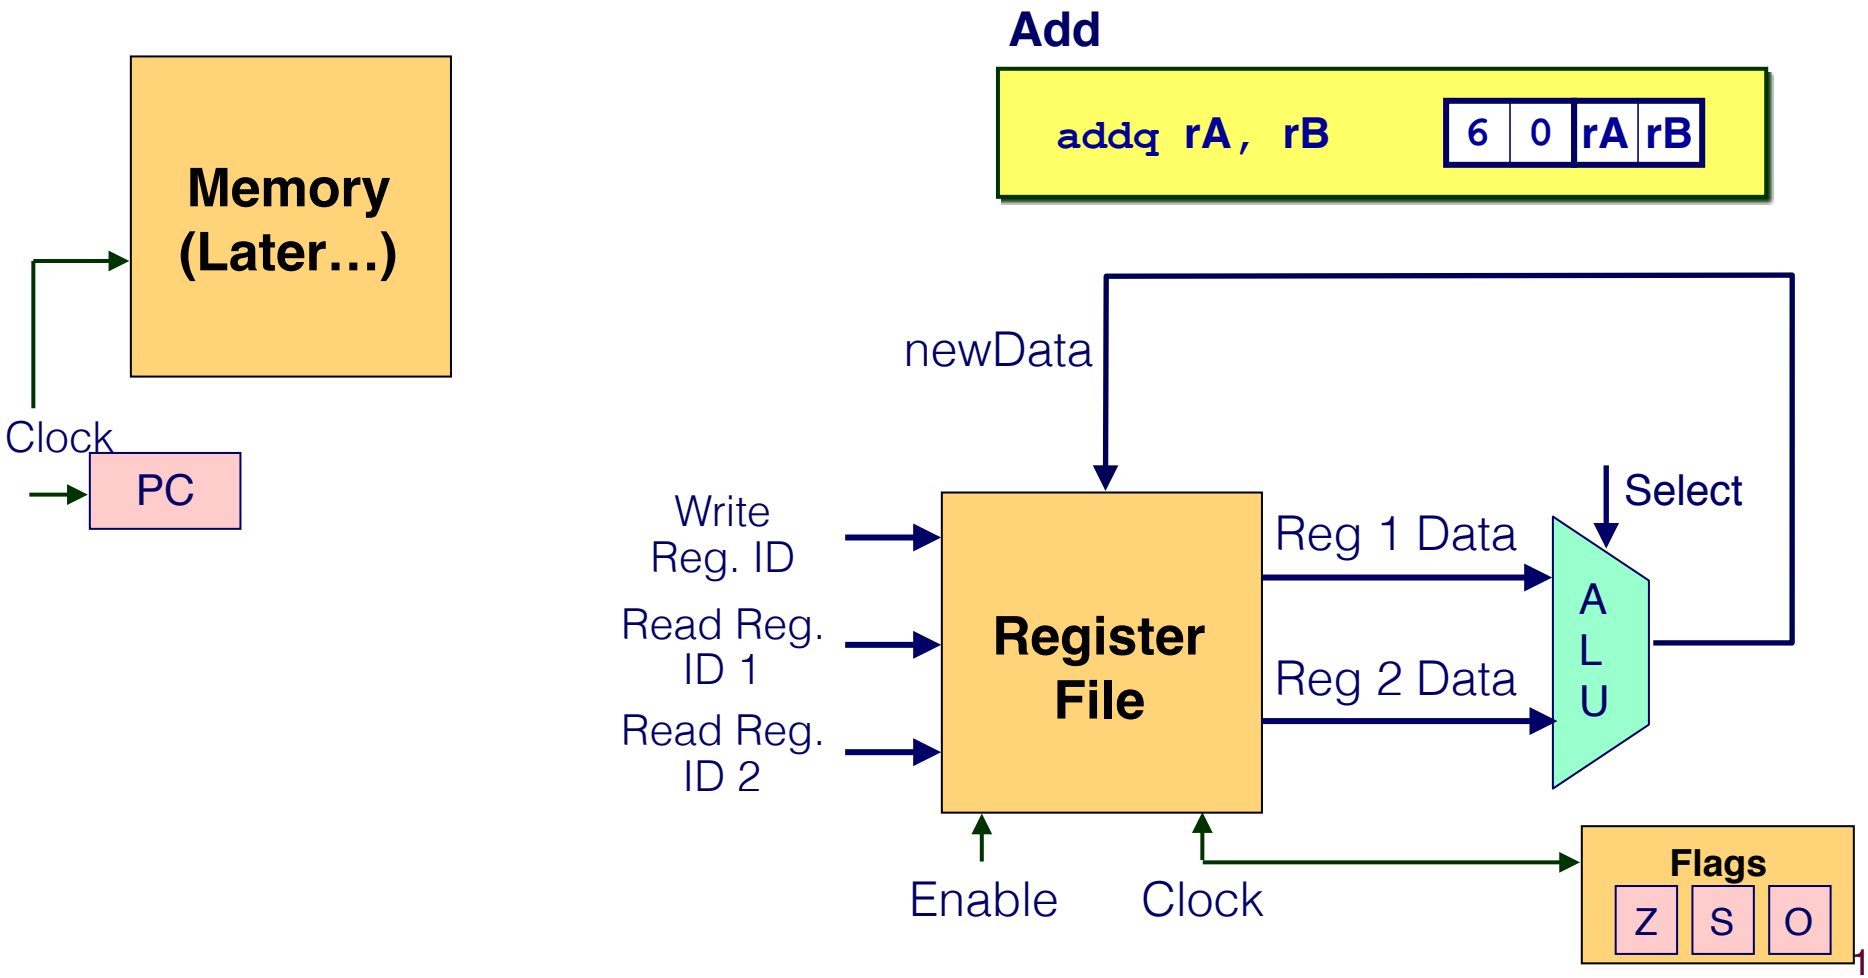
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



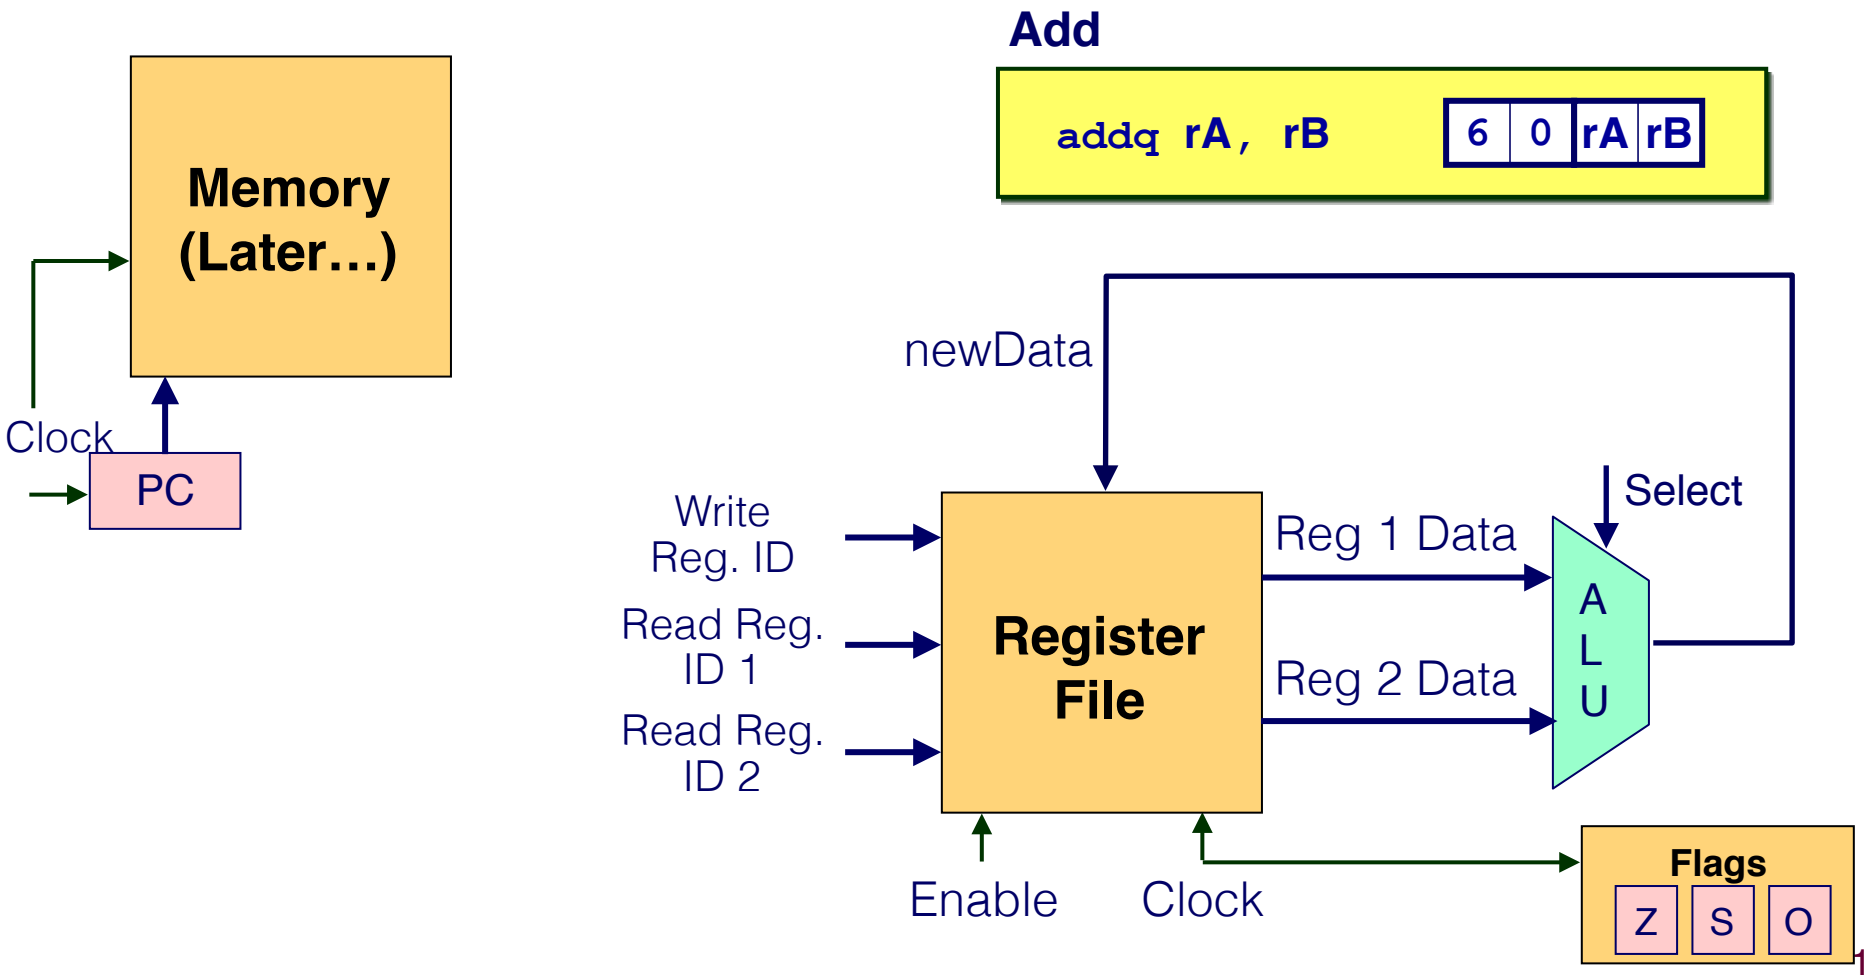
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



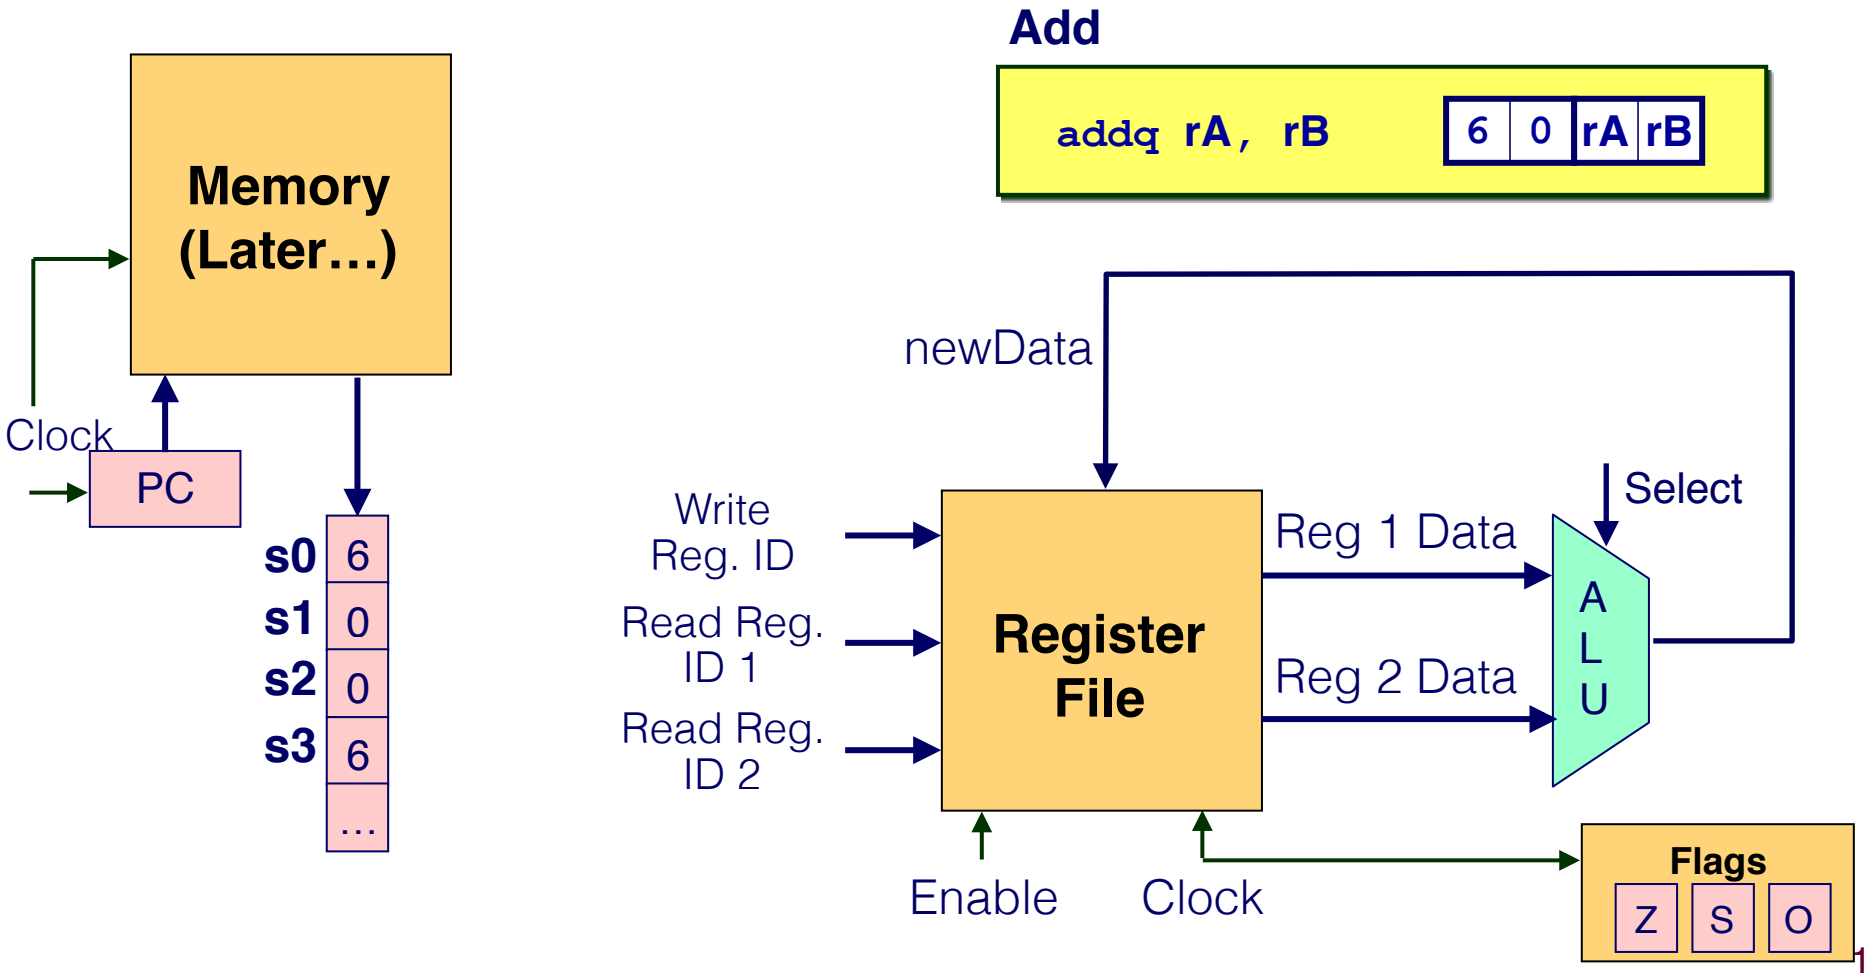
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



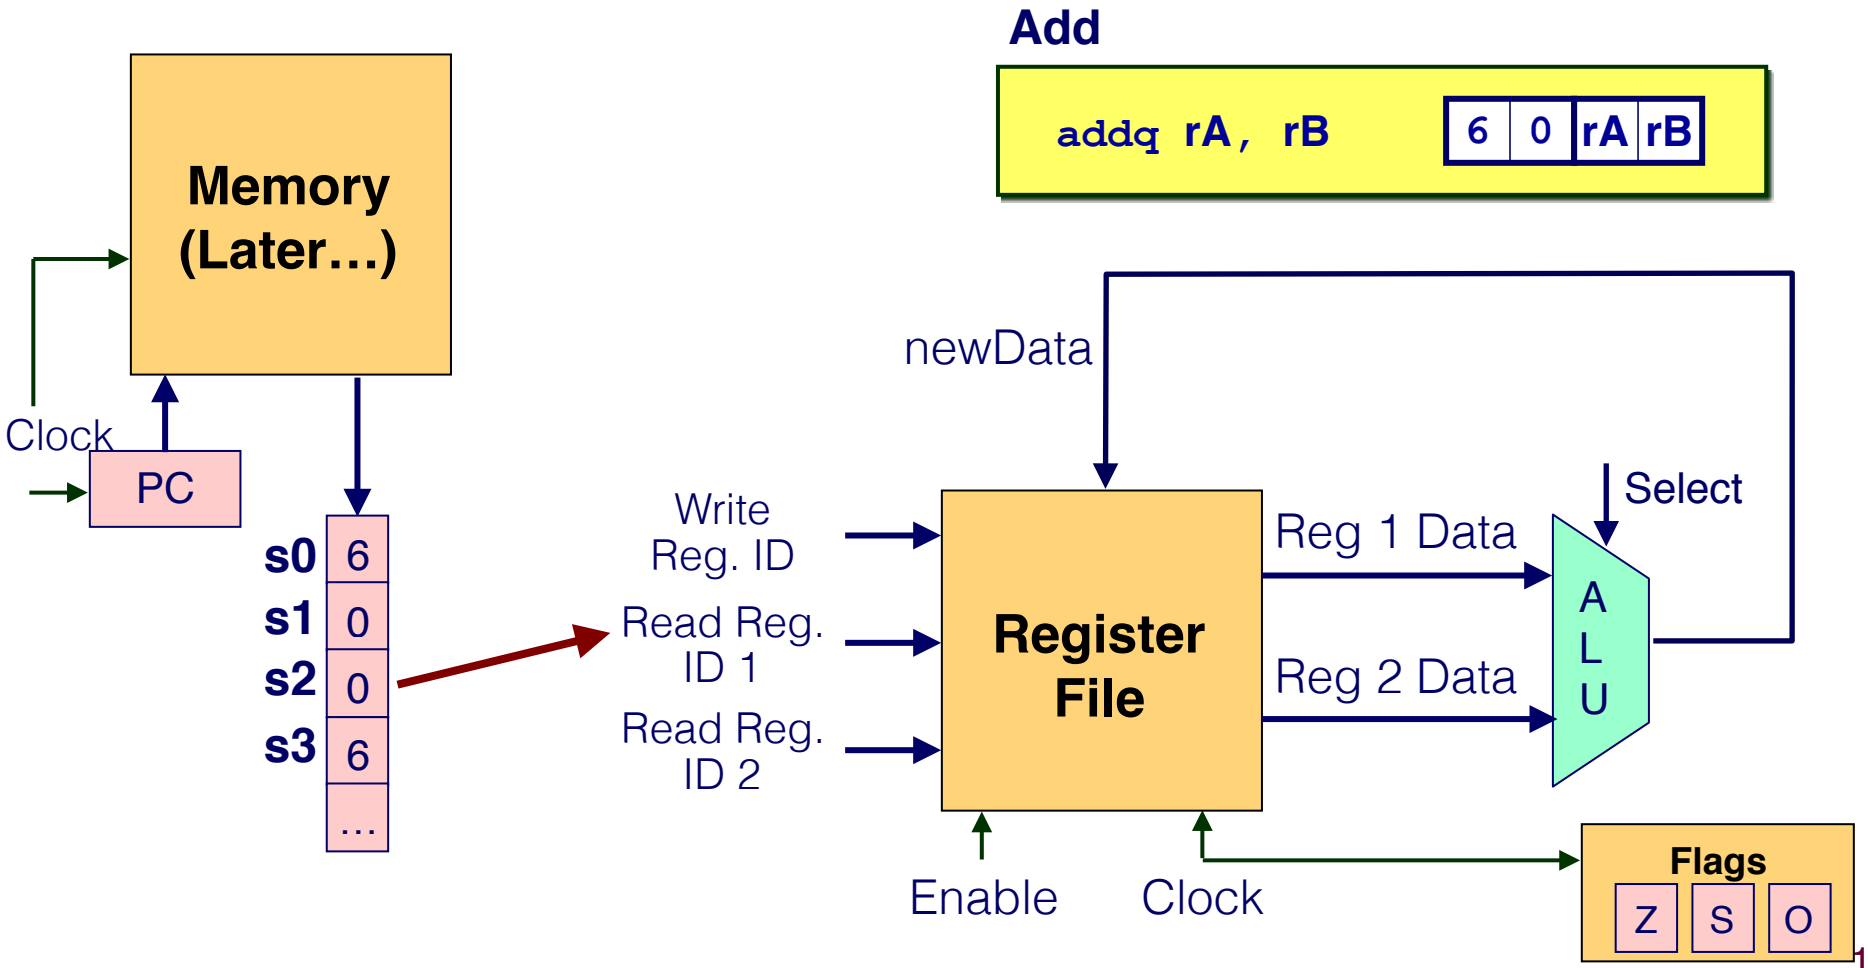
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



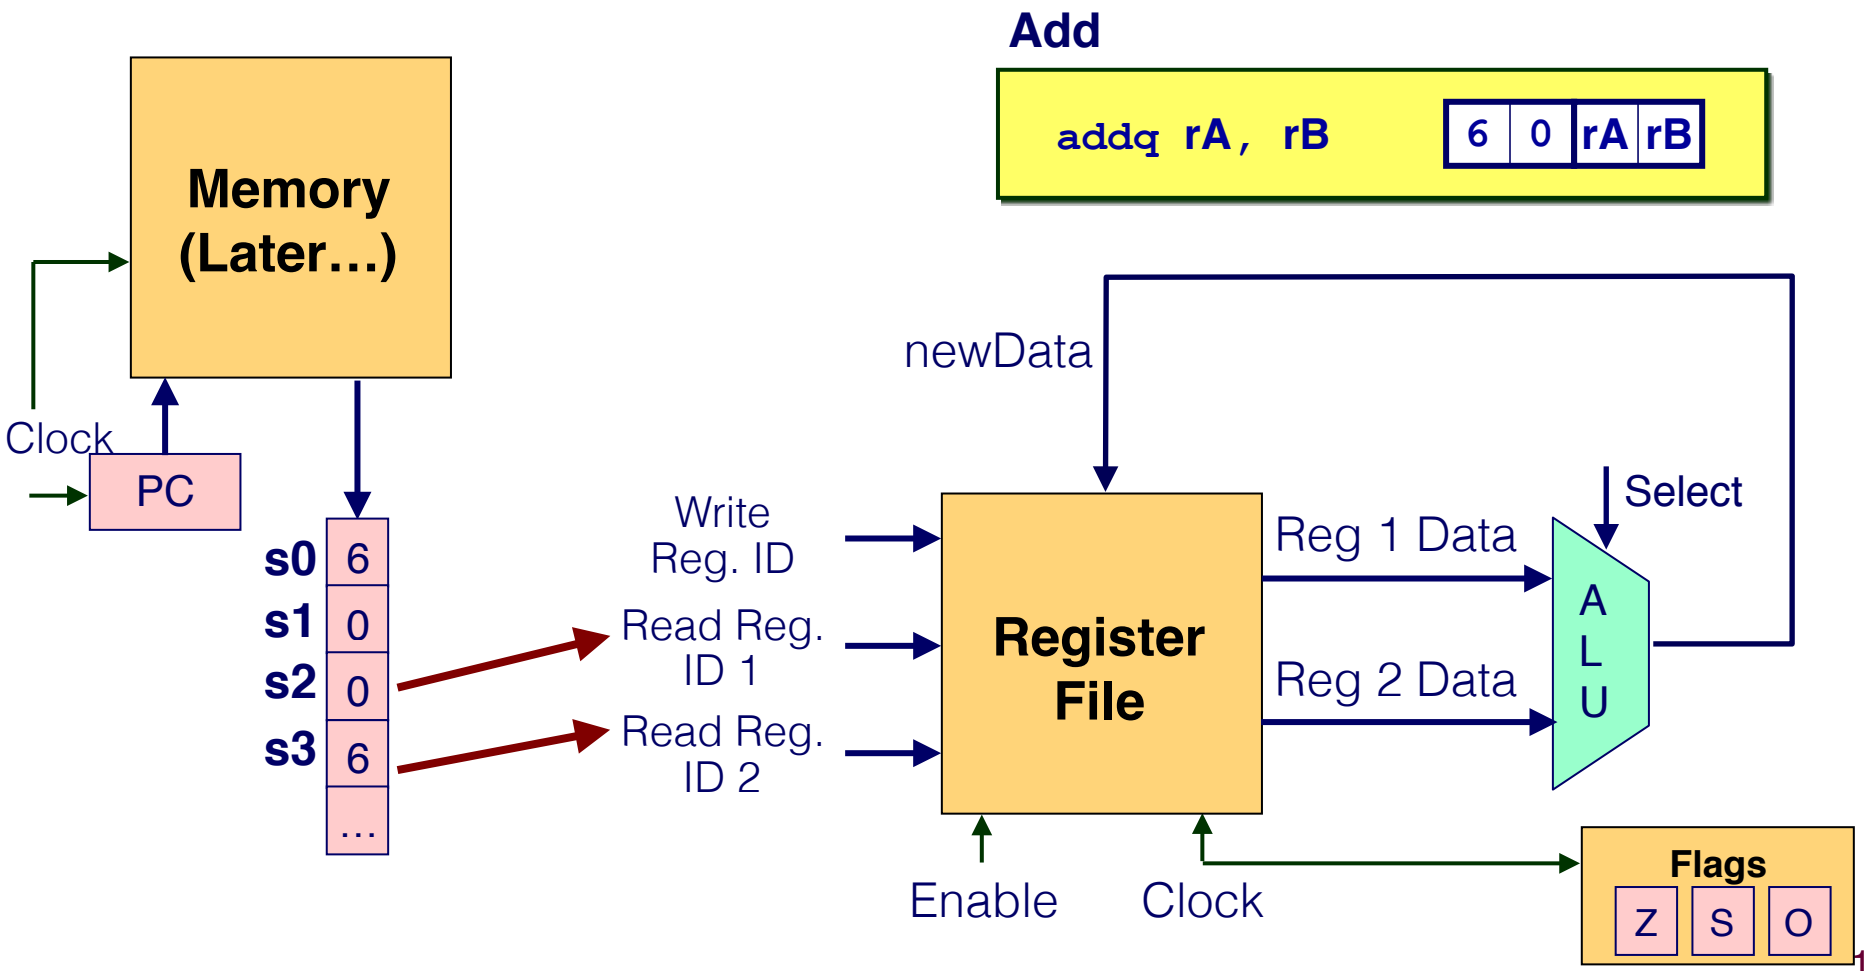
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



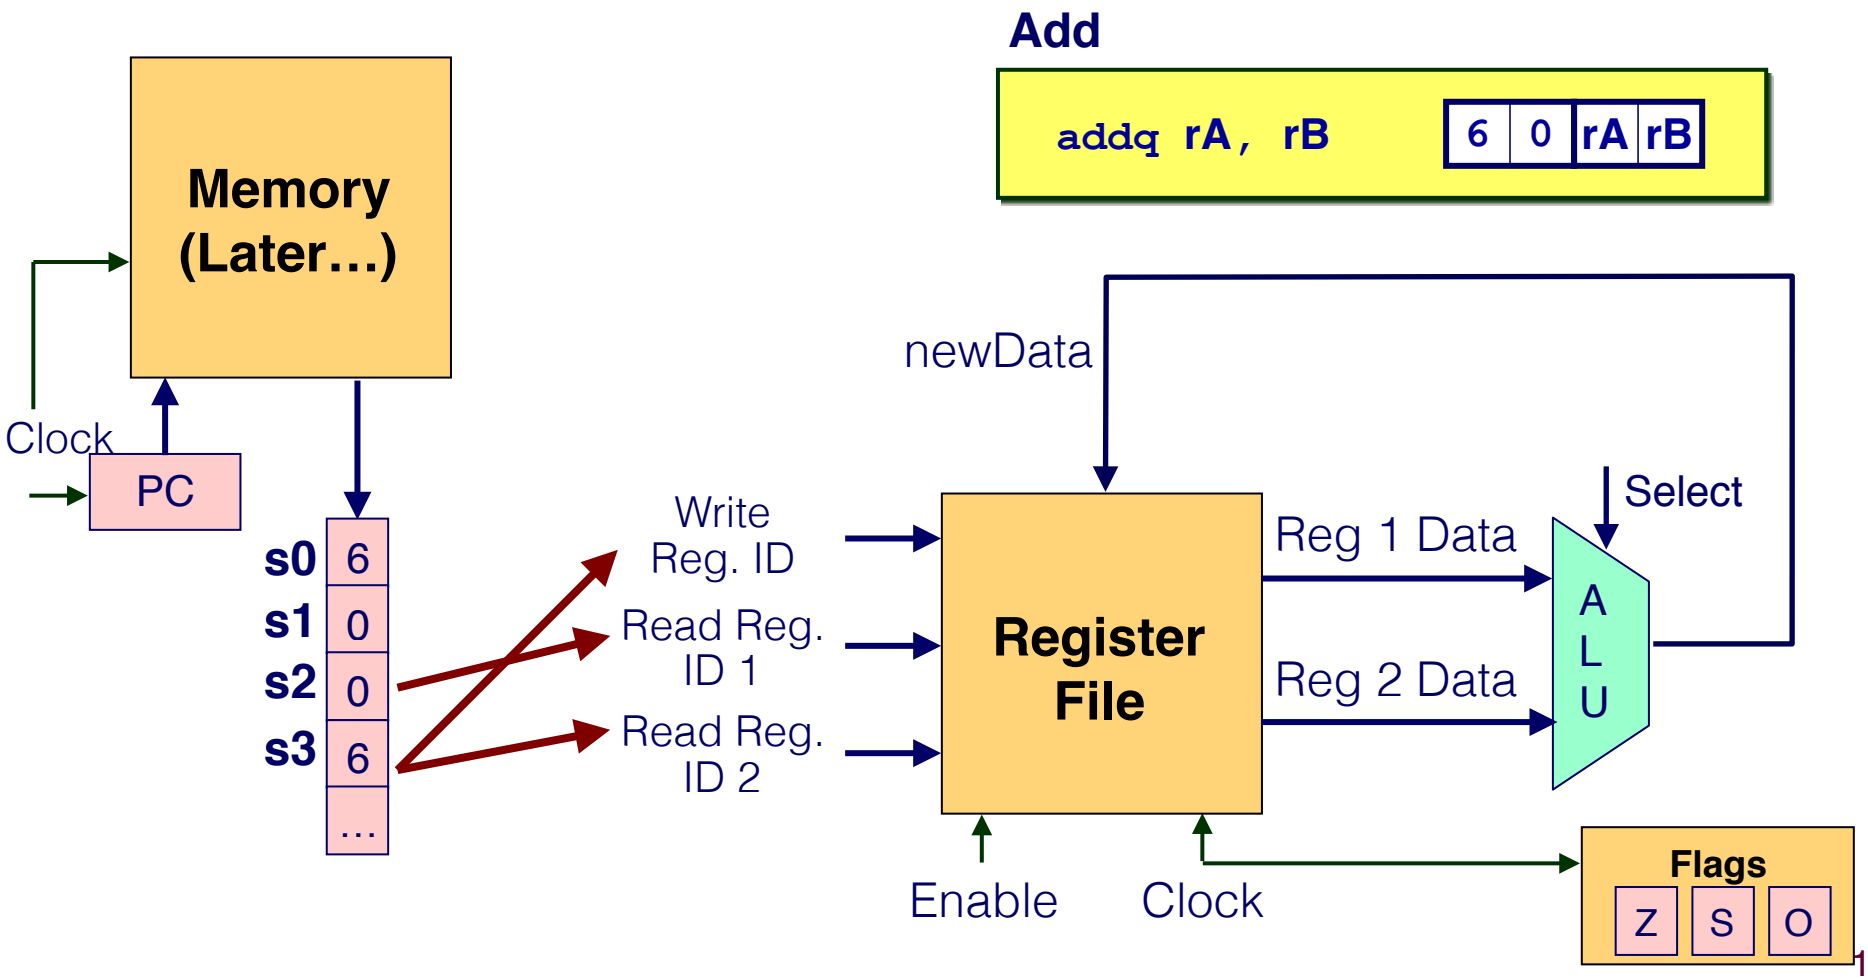
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



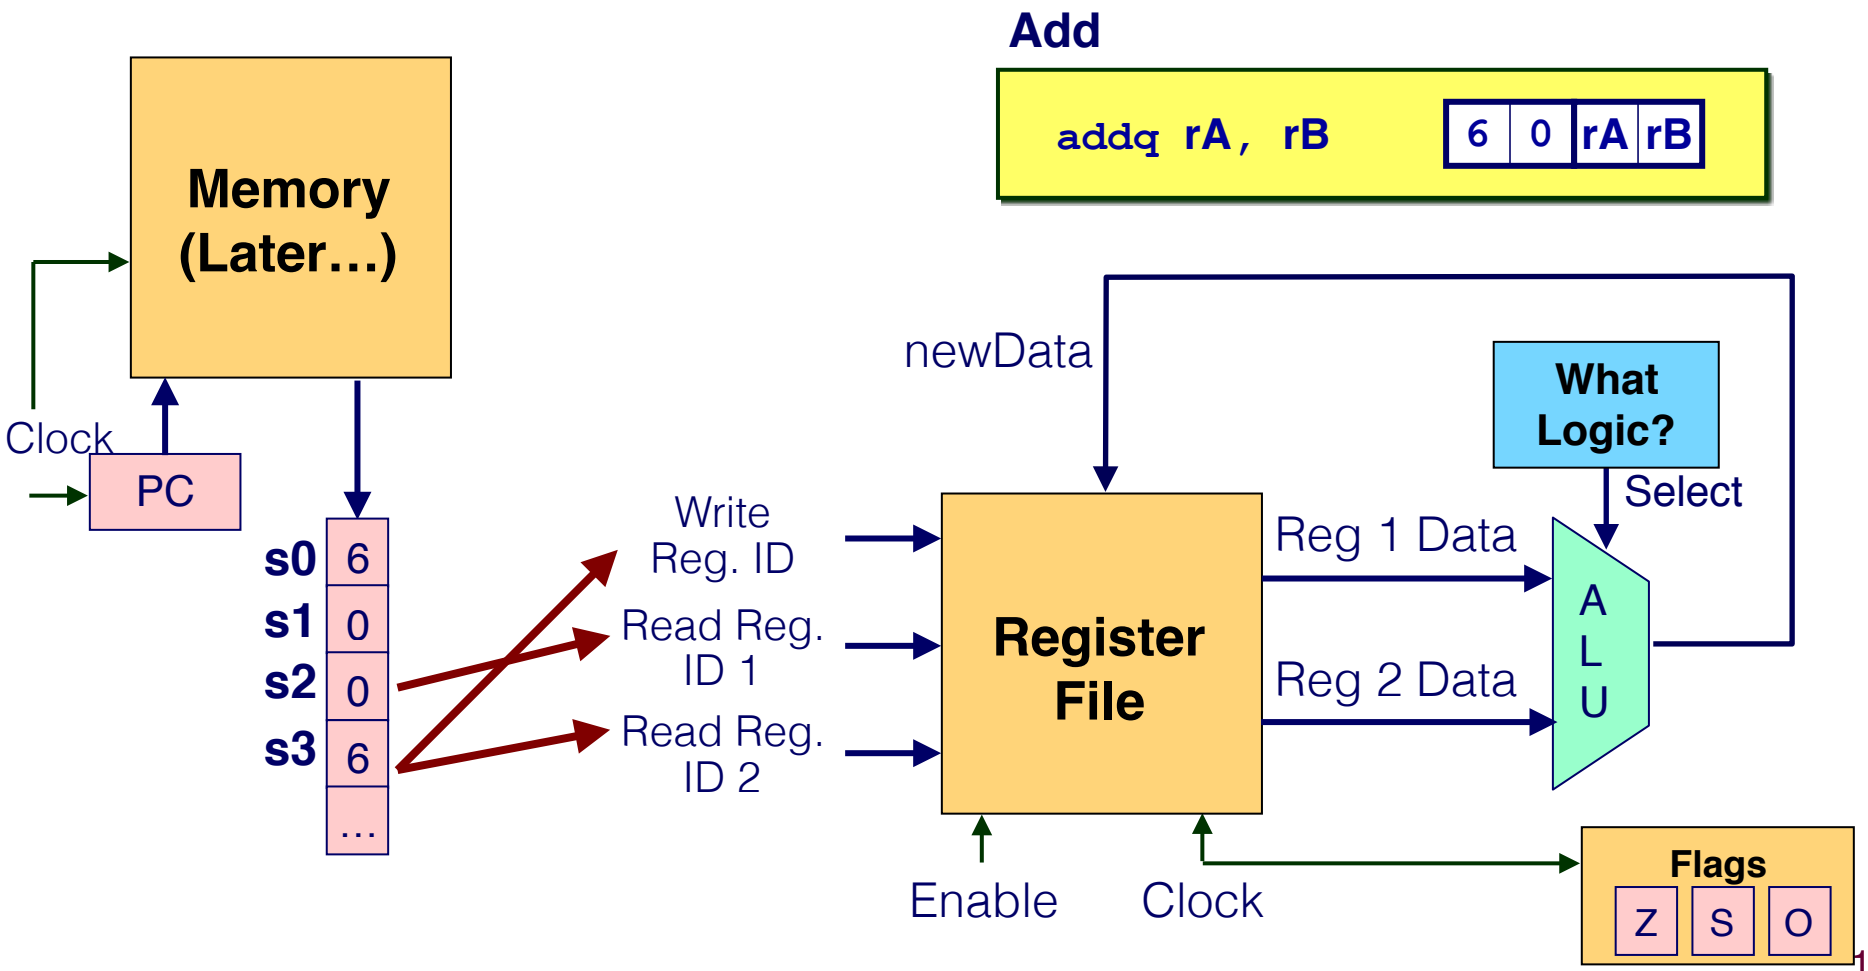
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



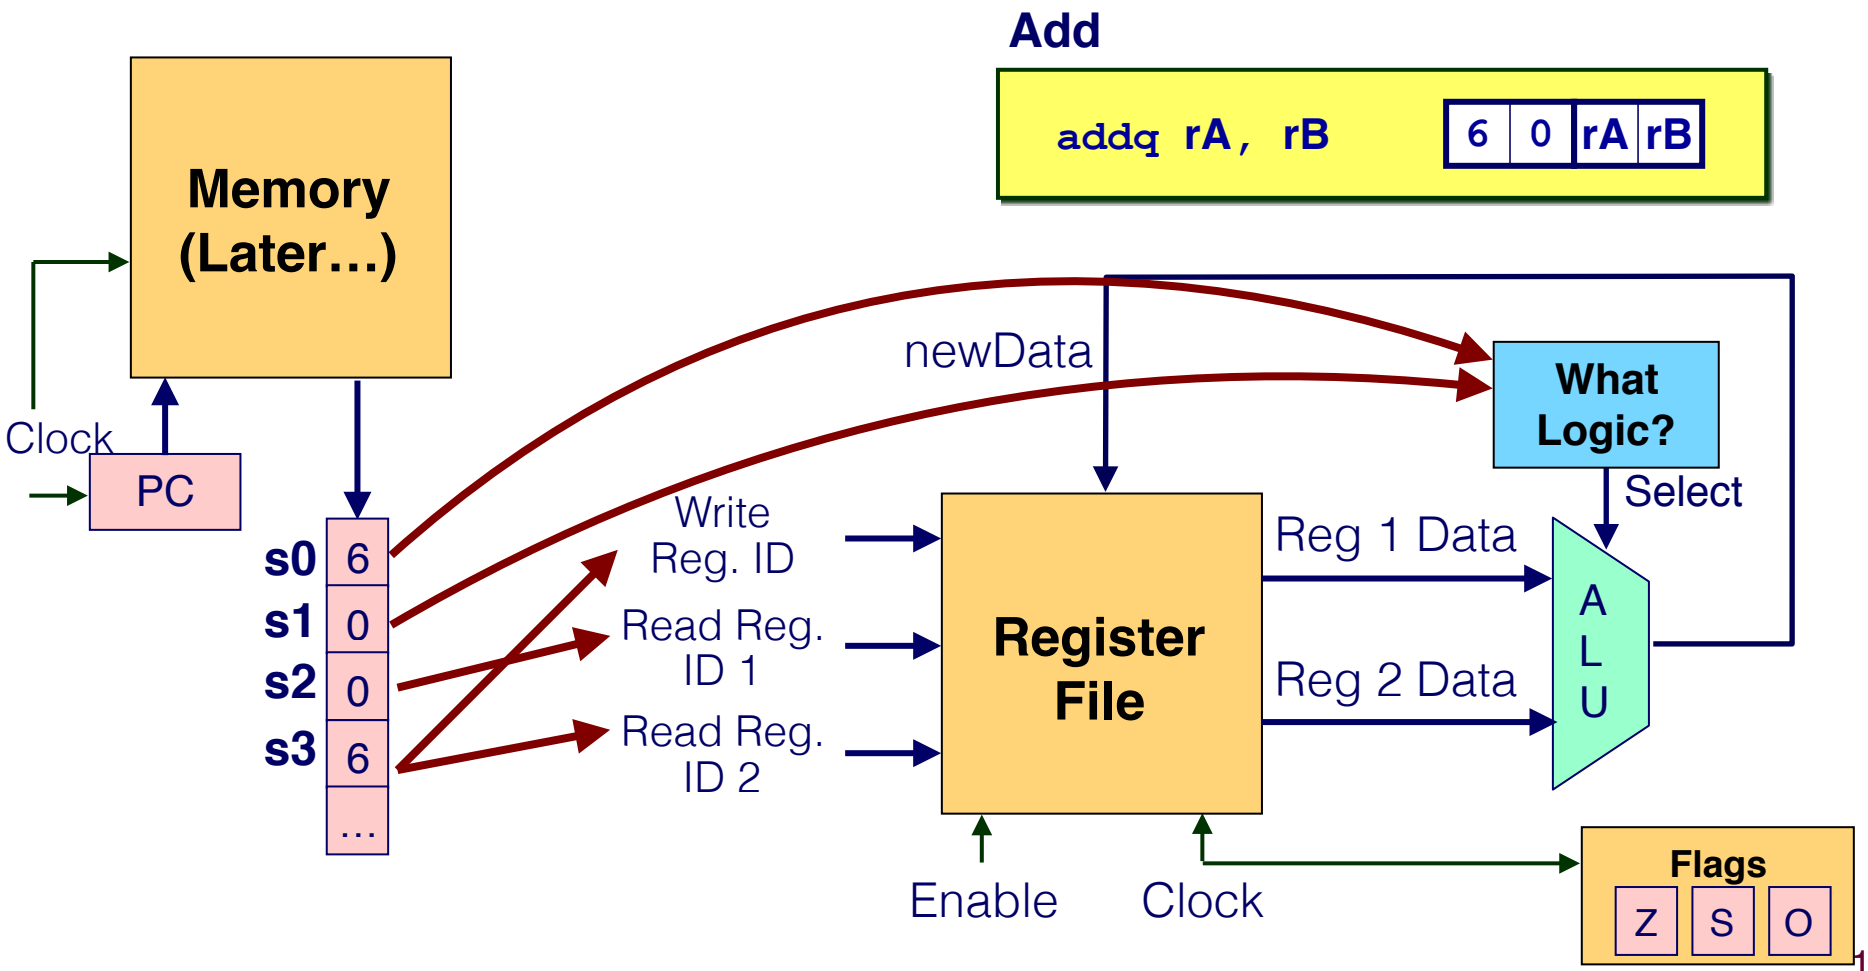
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



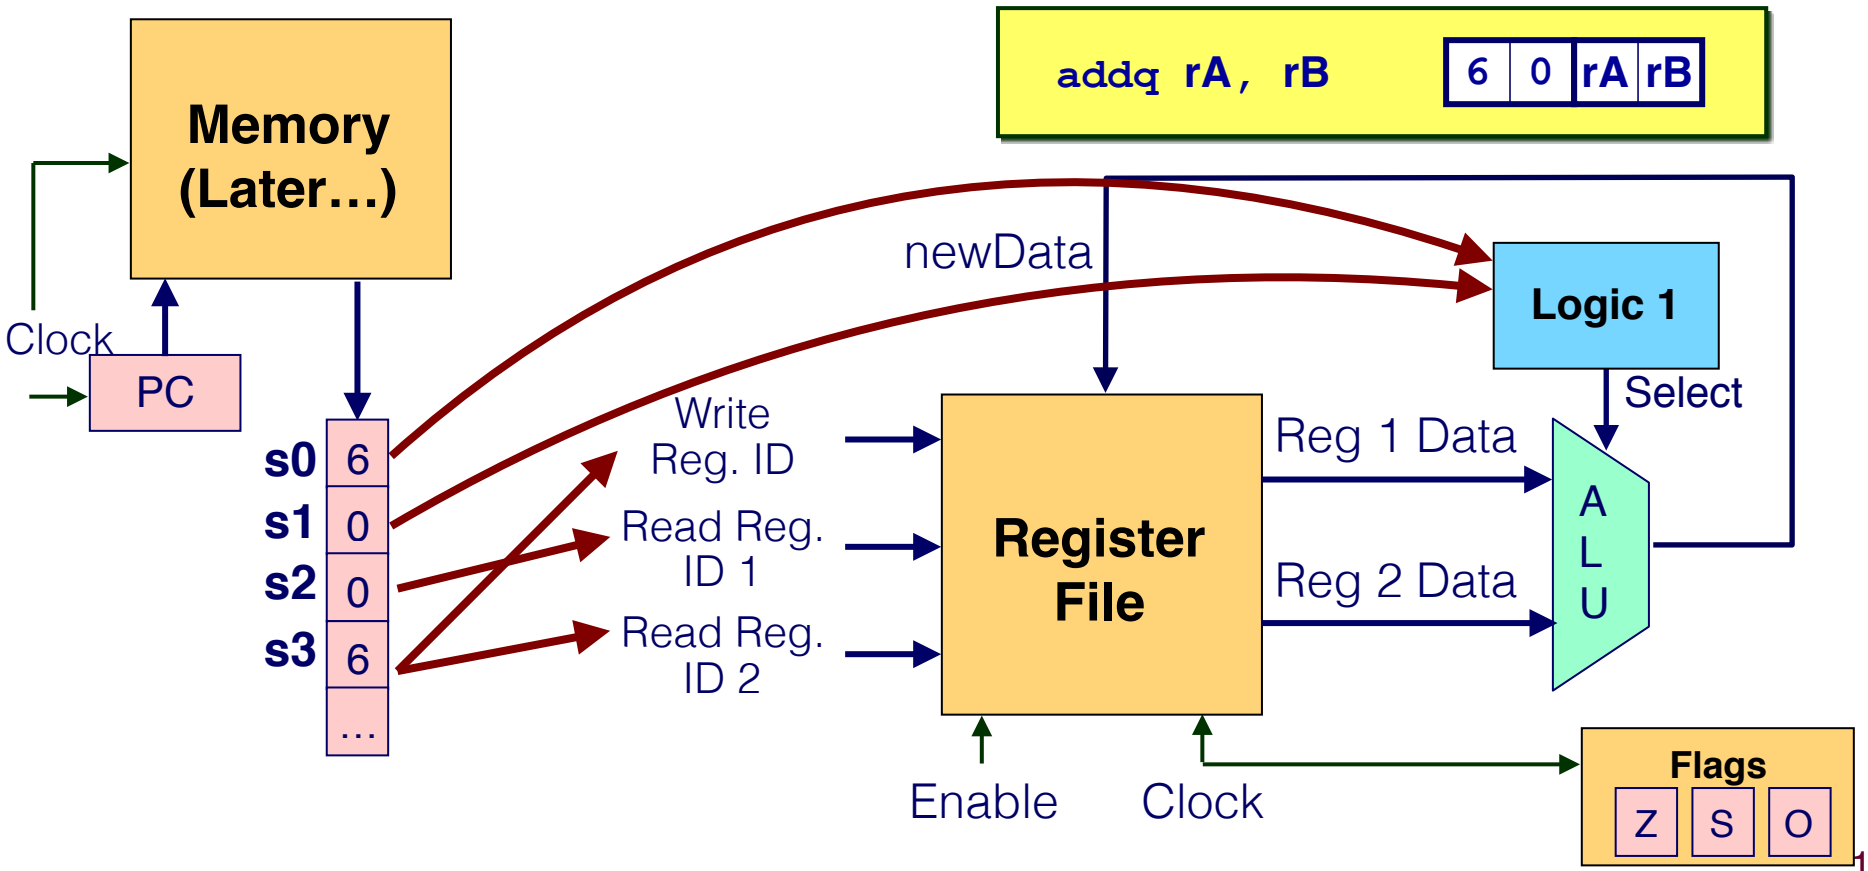
Executing an ADD instruction

- How does the processor execute `addq %rax,%rsi`
- The binary encoding is `60 06`



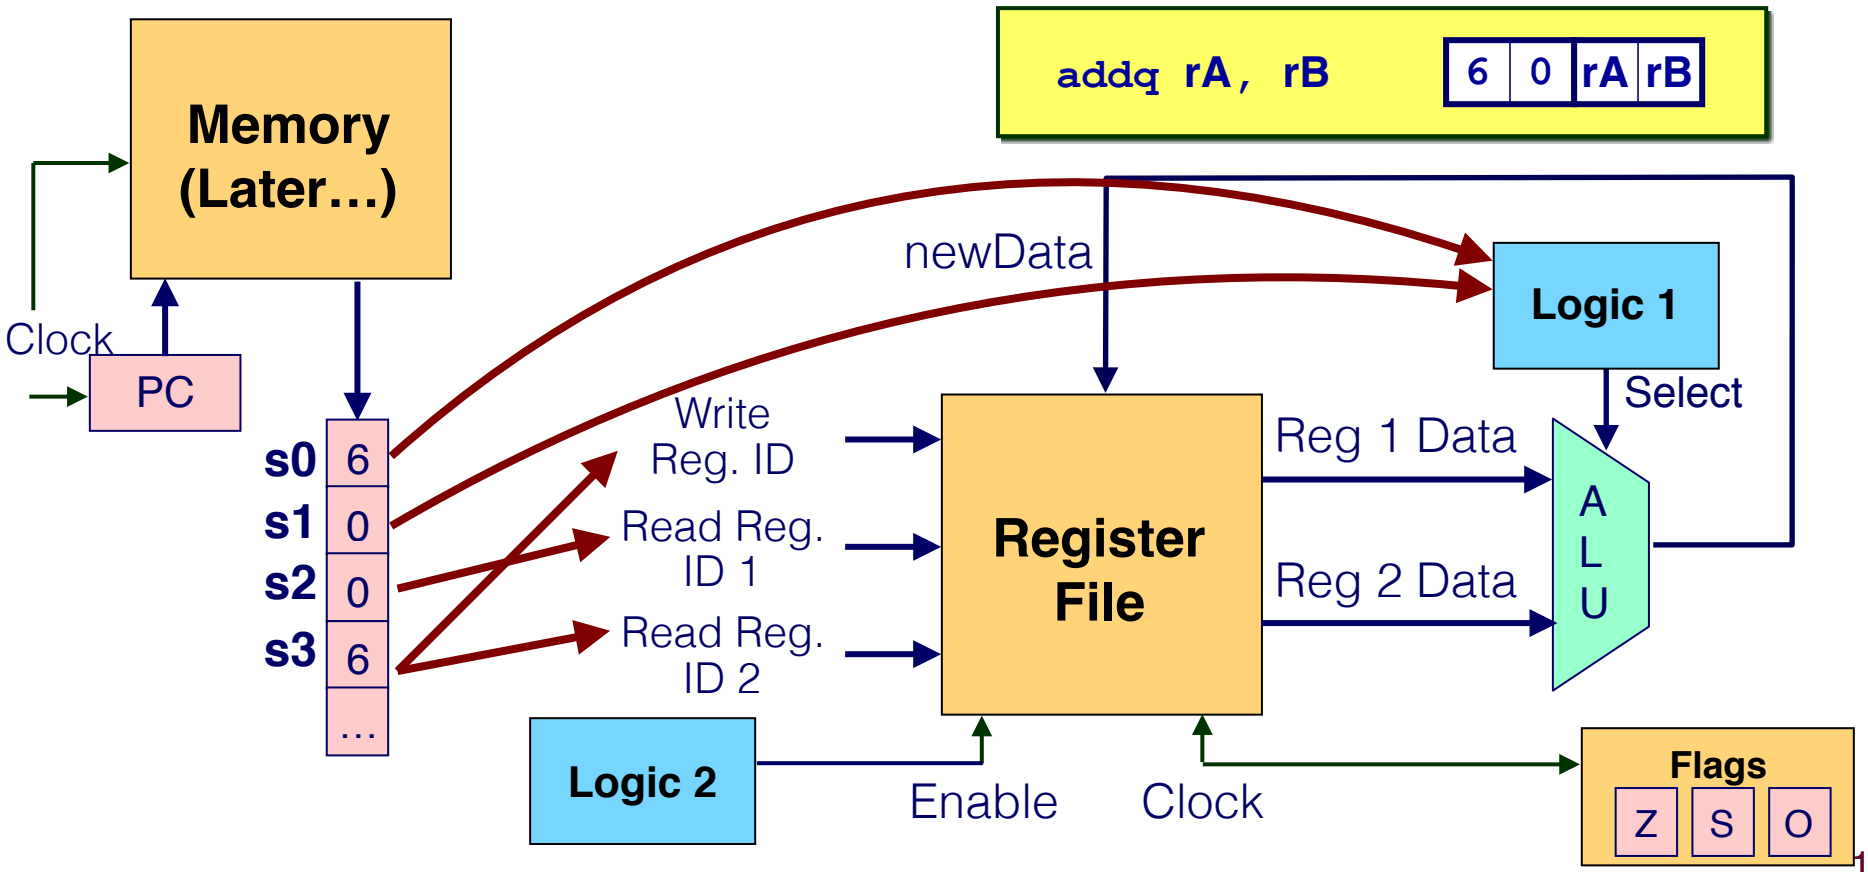
Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;



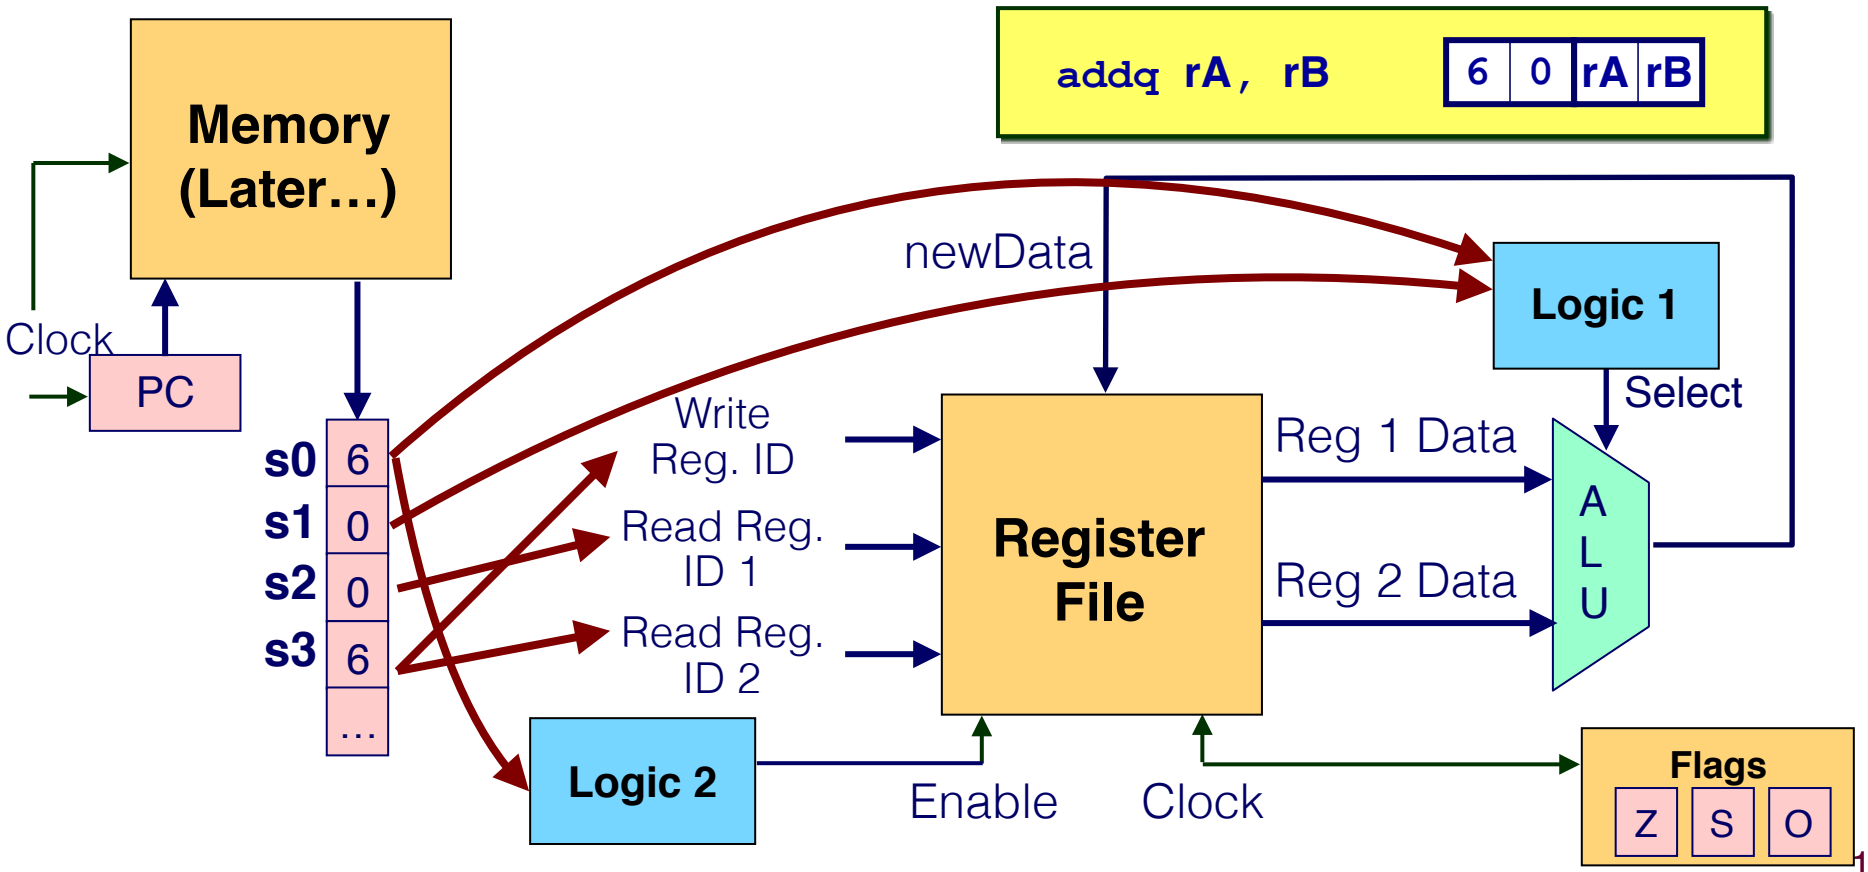
Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;



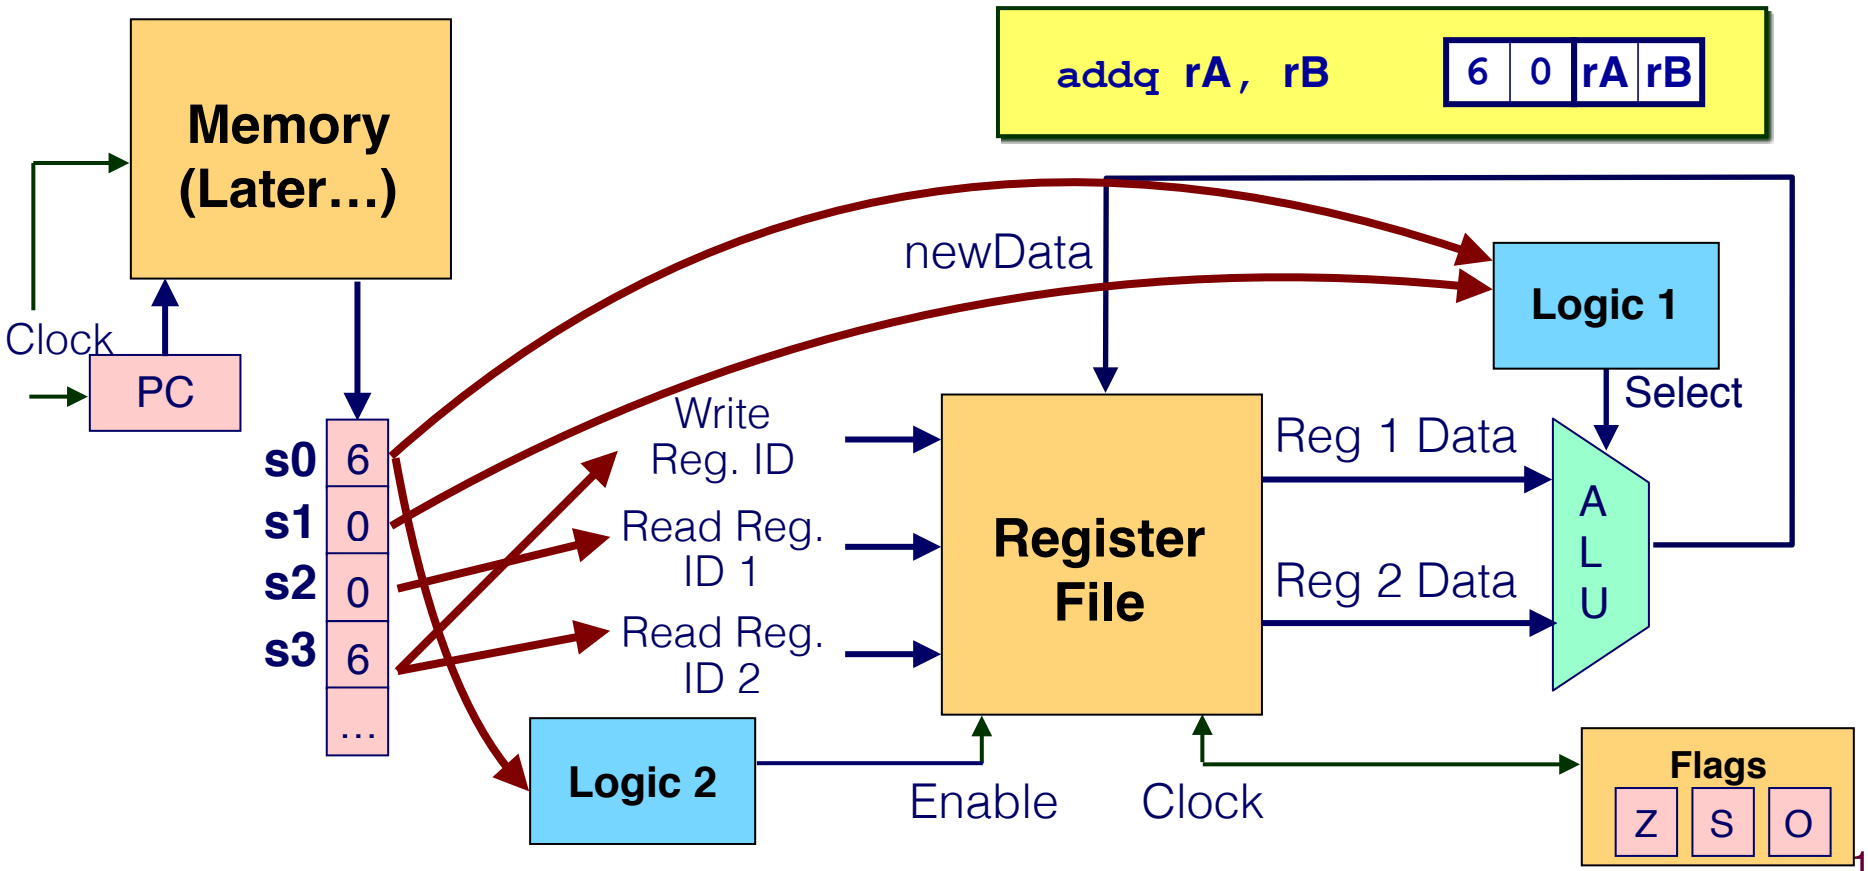
Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;



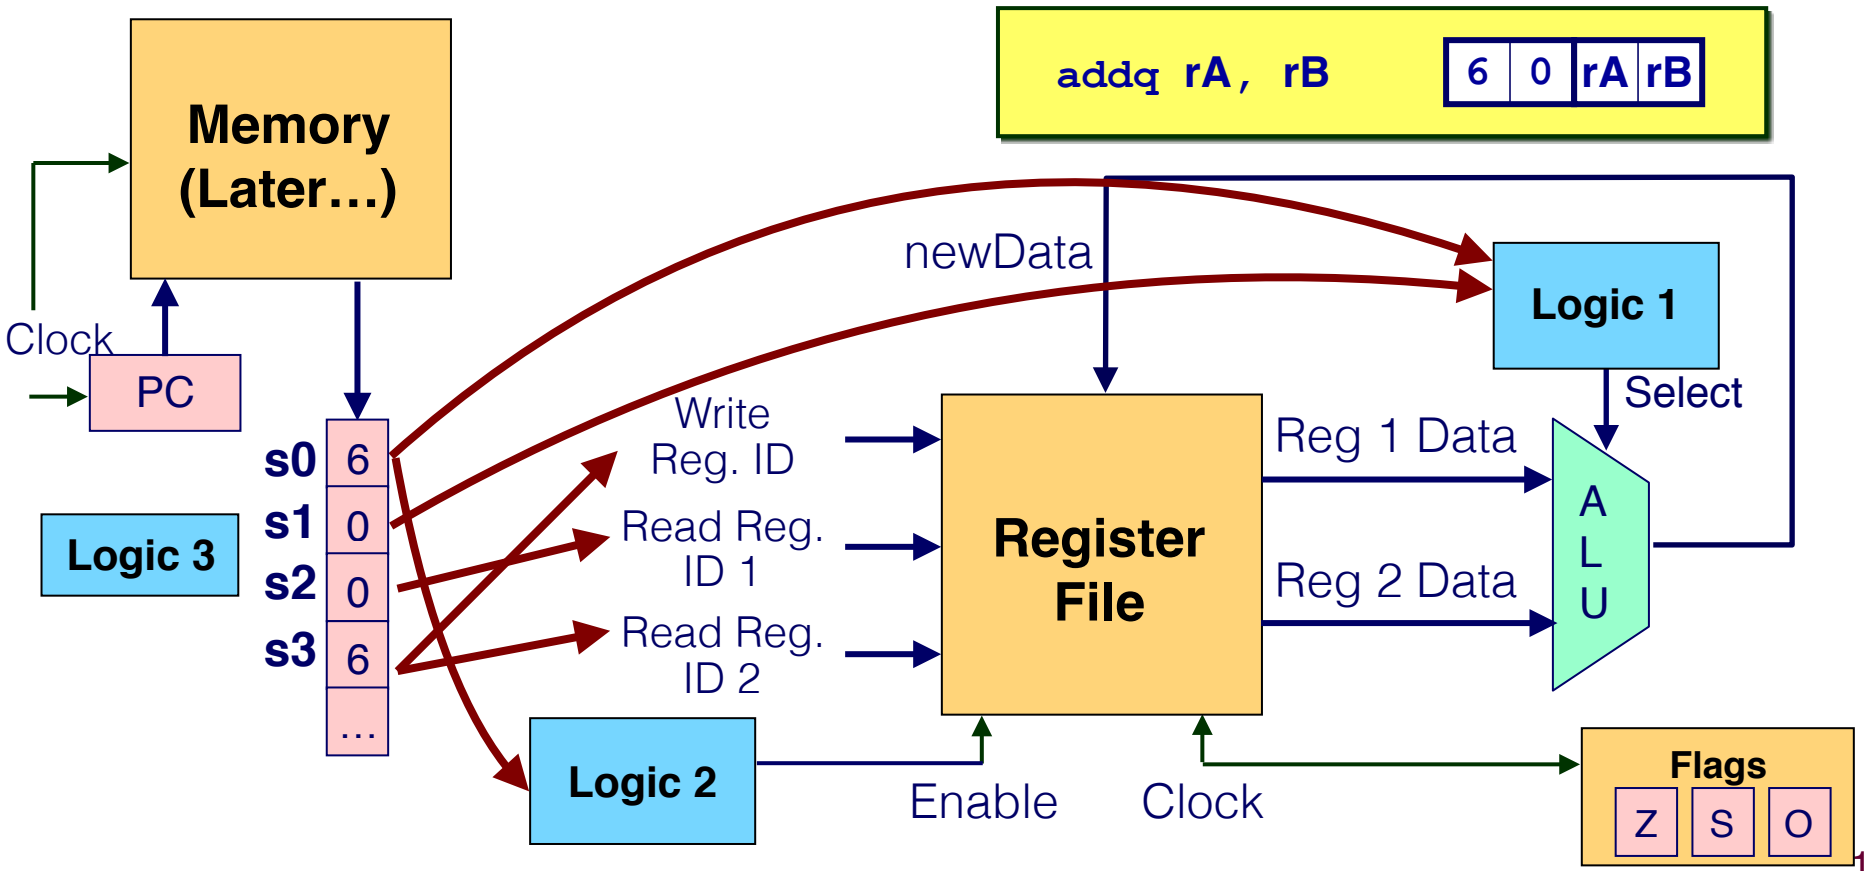
Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;



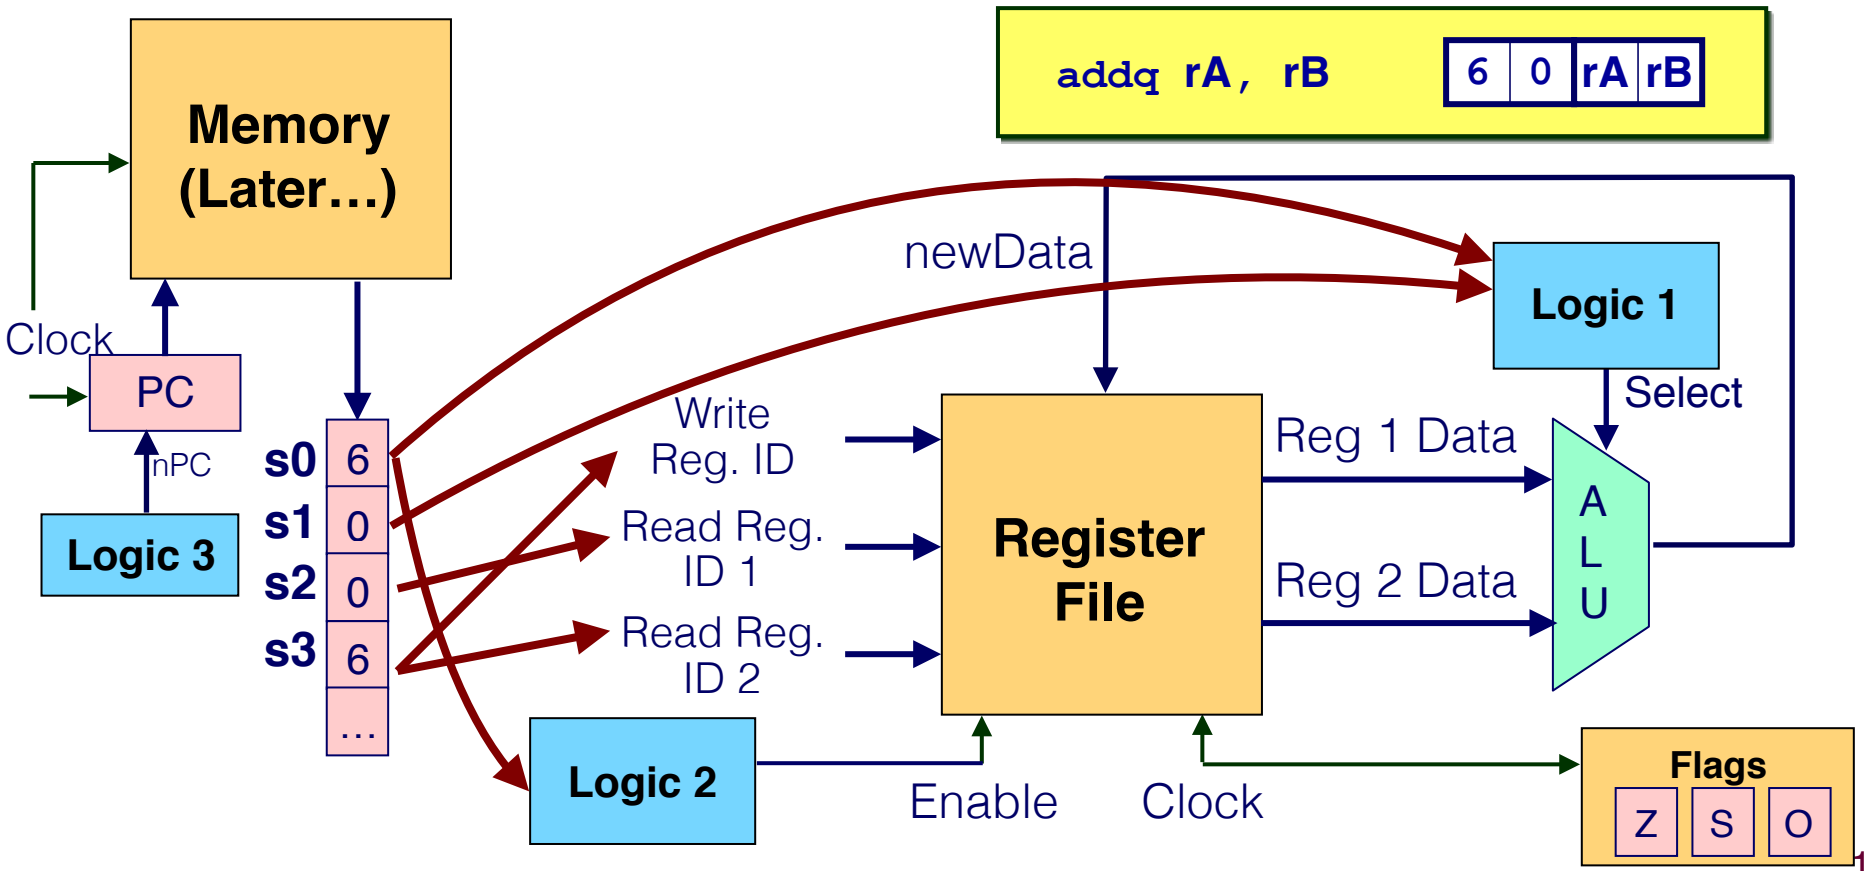
Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;



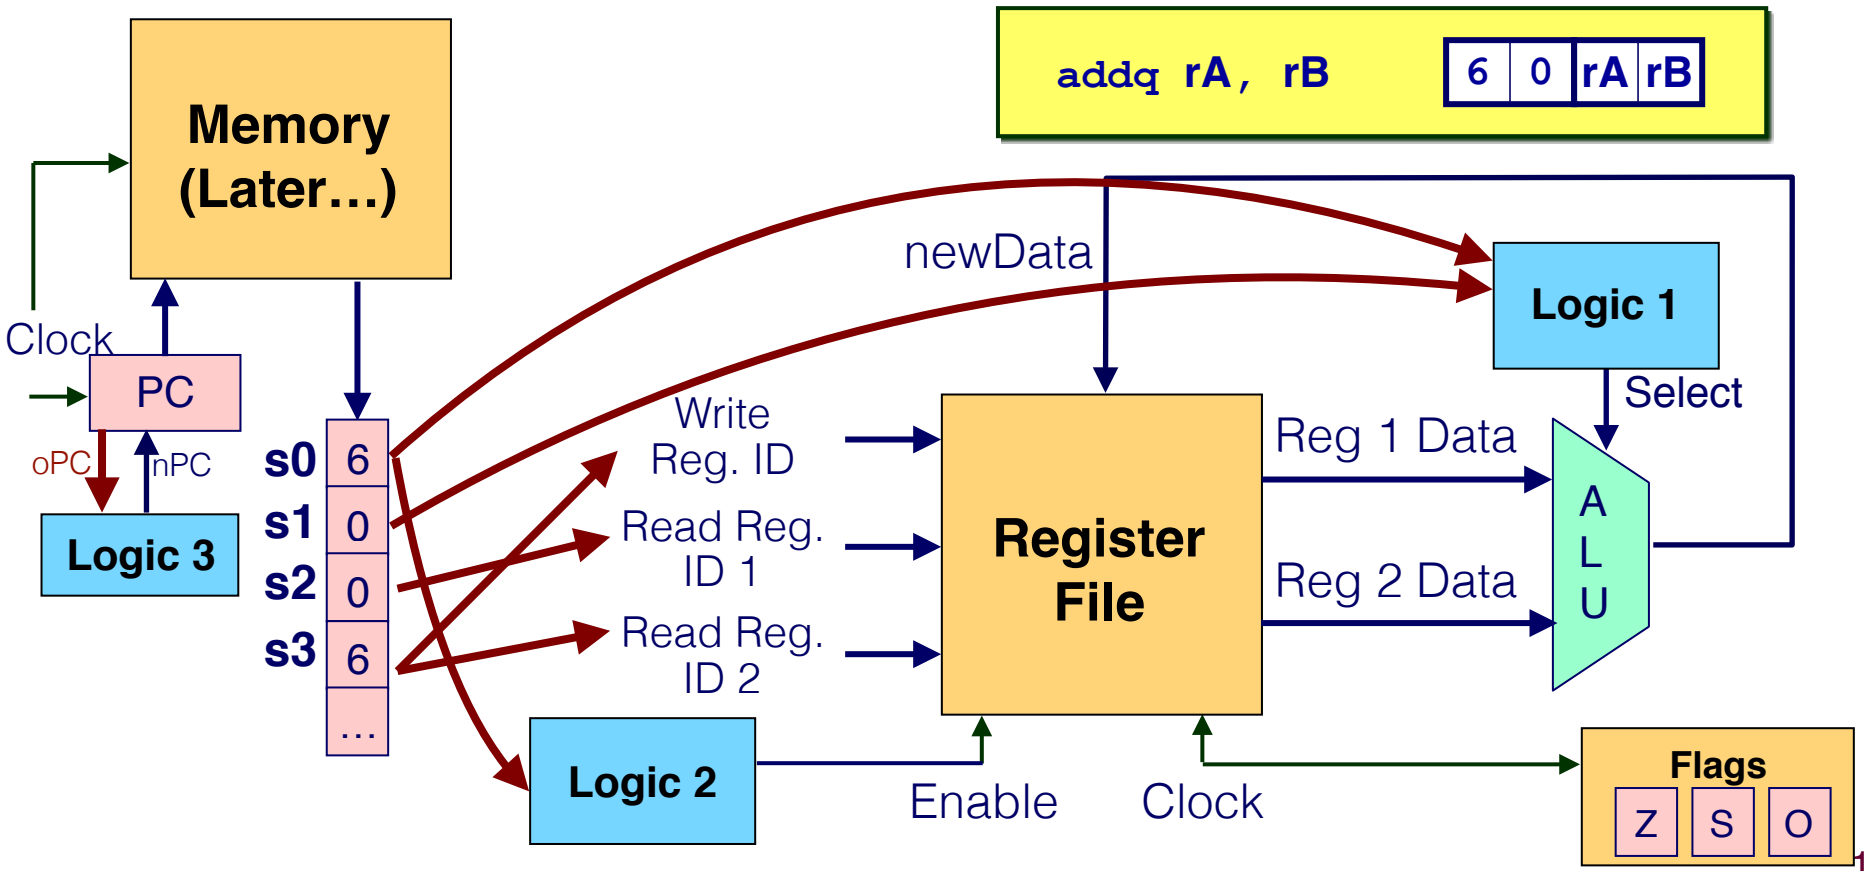
Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;



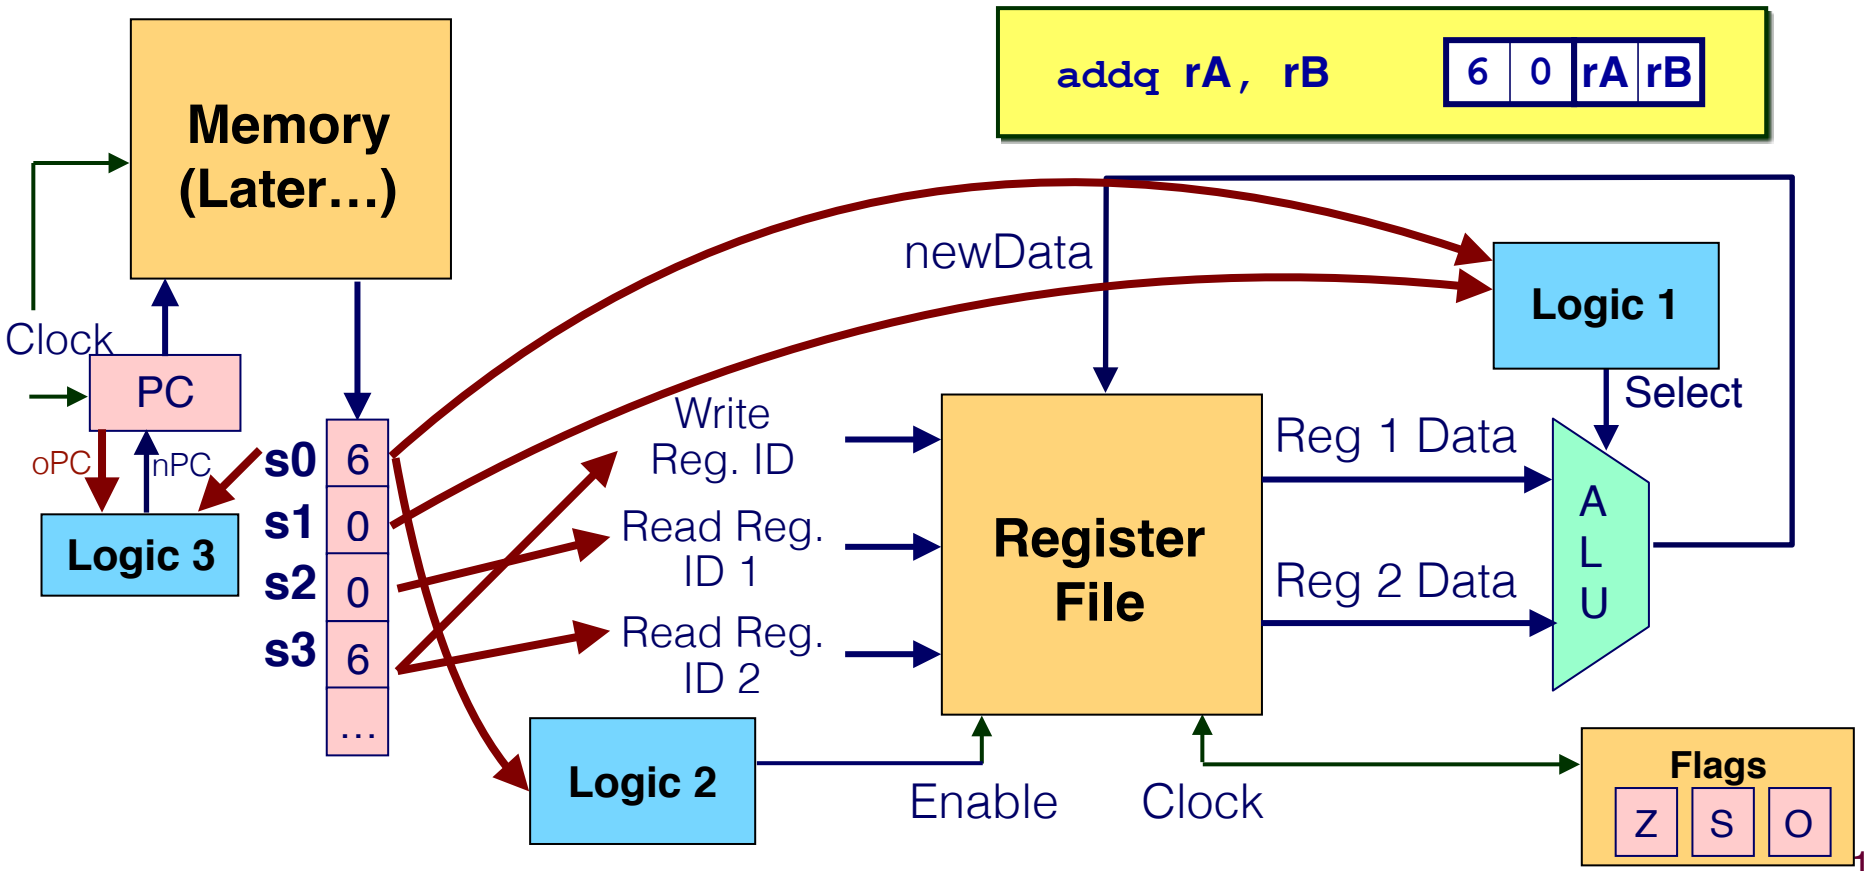
Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;



Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;



Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;
- Logic 3: if (s0 == 6) nPC = oPC + 2;

Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;
- Logic 3: if (s0 == 6) nPC = oPC + 2;
- How about Logic 4?

Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;
- Logic 3: if (s0 == 6) nPC = oPC + 2;
- How about Logic 4?

How do these logics get implemented?

Executing an ADD instruction

- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;
- Logic 3: if (s0 == 6) nPC = oPC + 2;
- How about Logic 4?

How do these logics get implemented?

Executing an ADD instruction

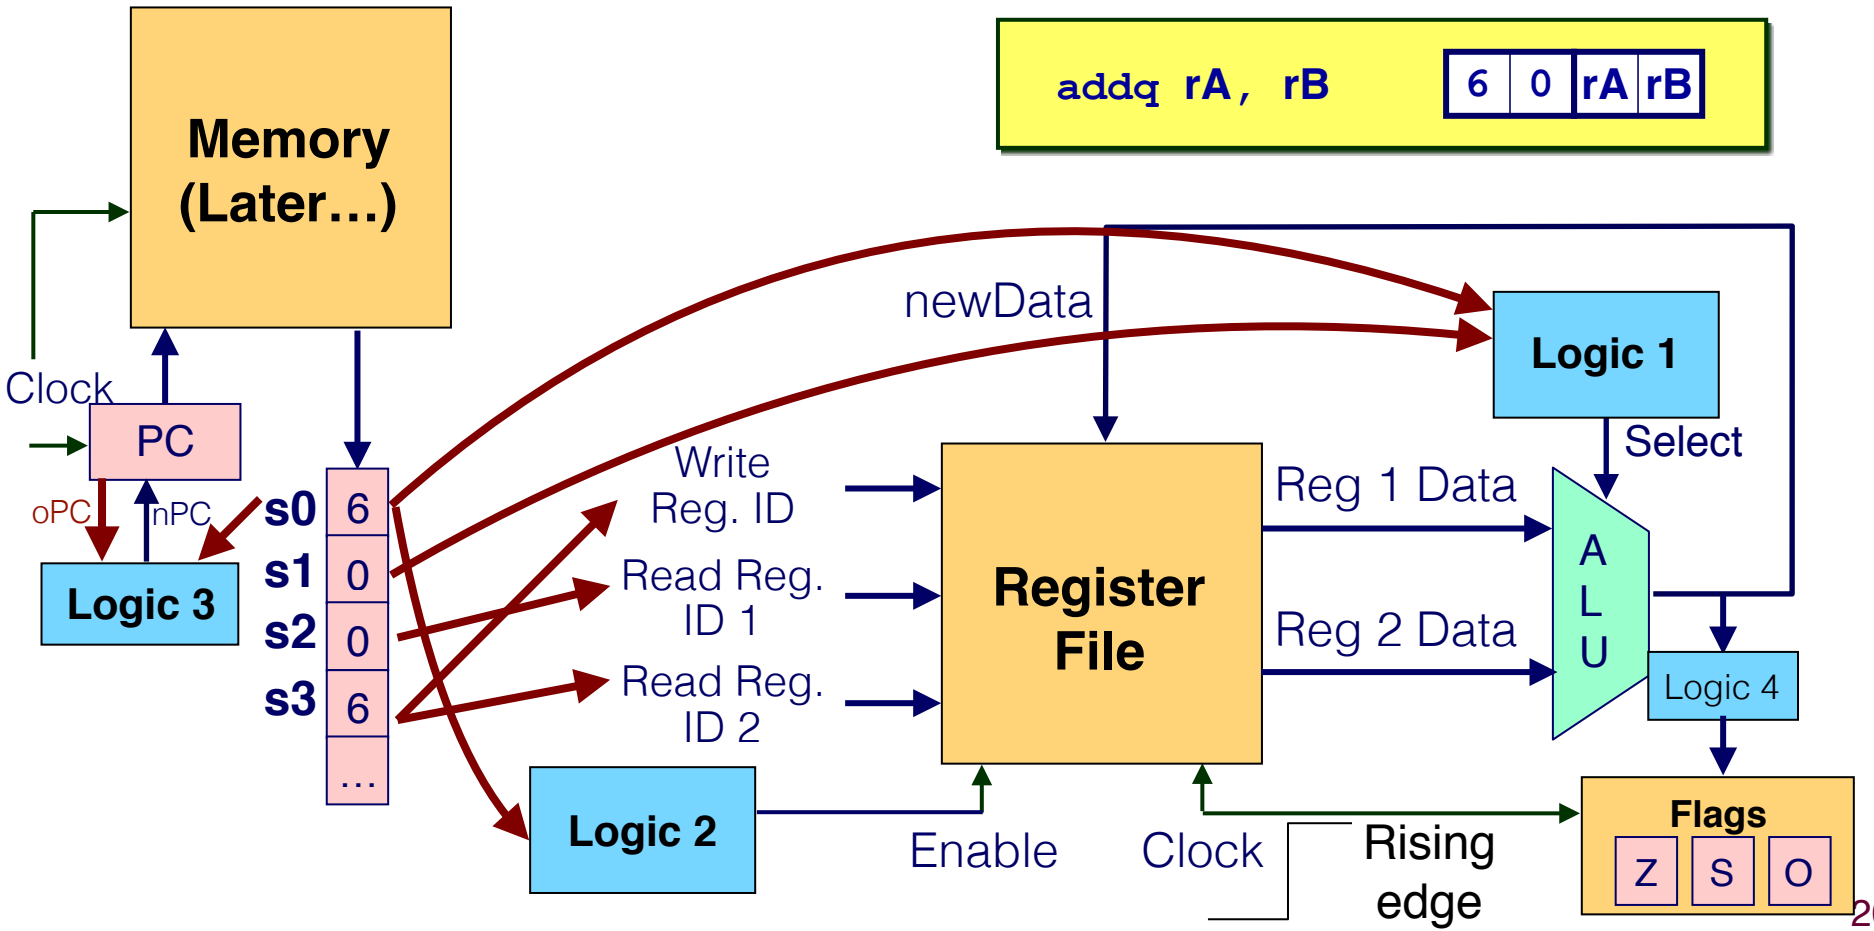
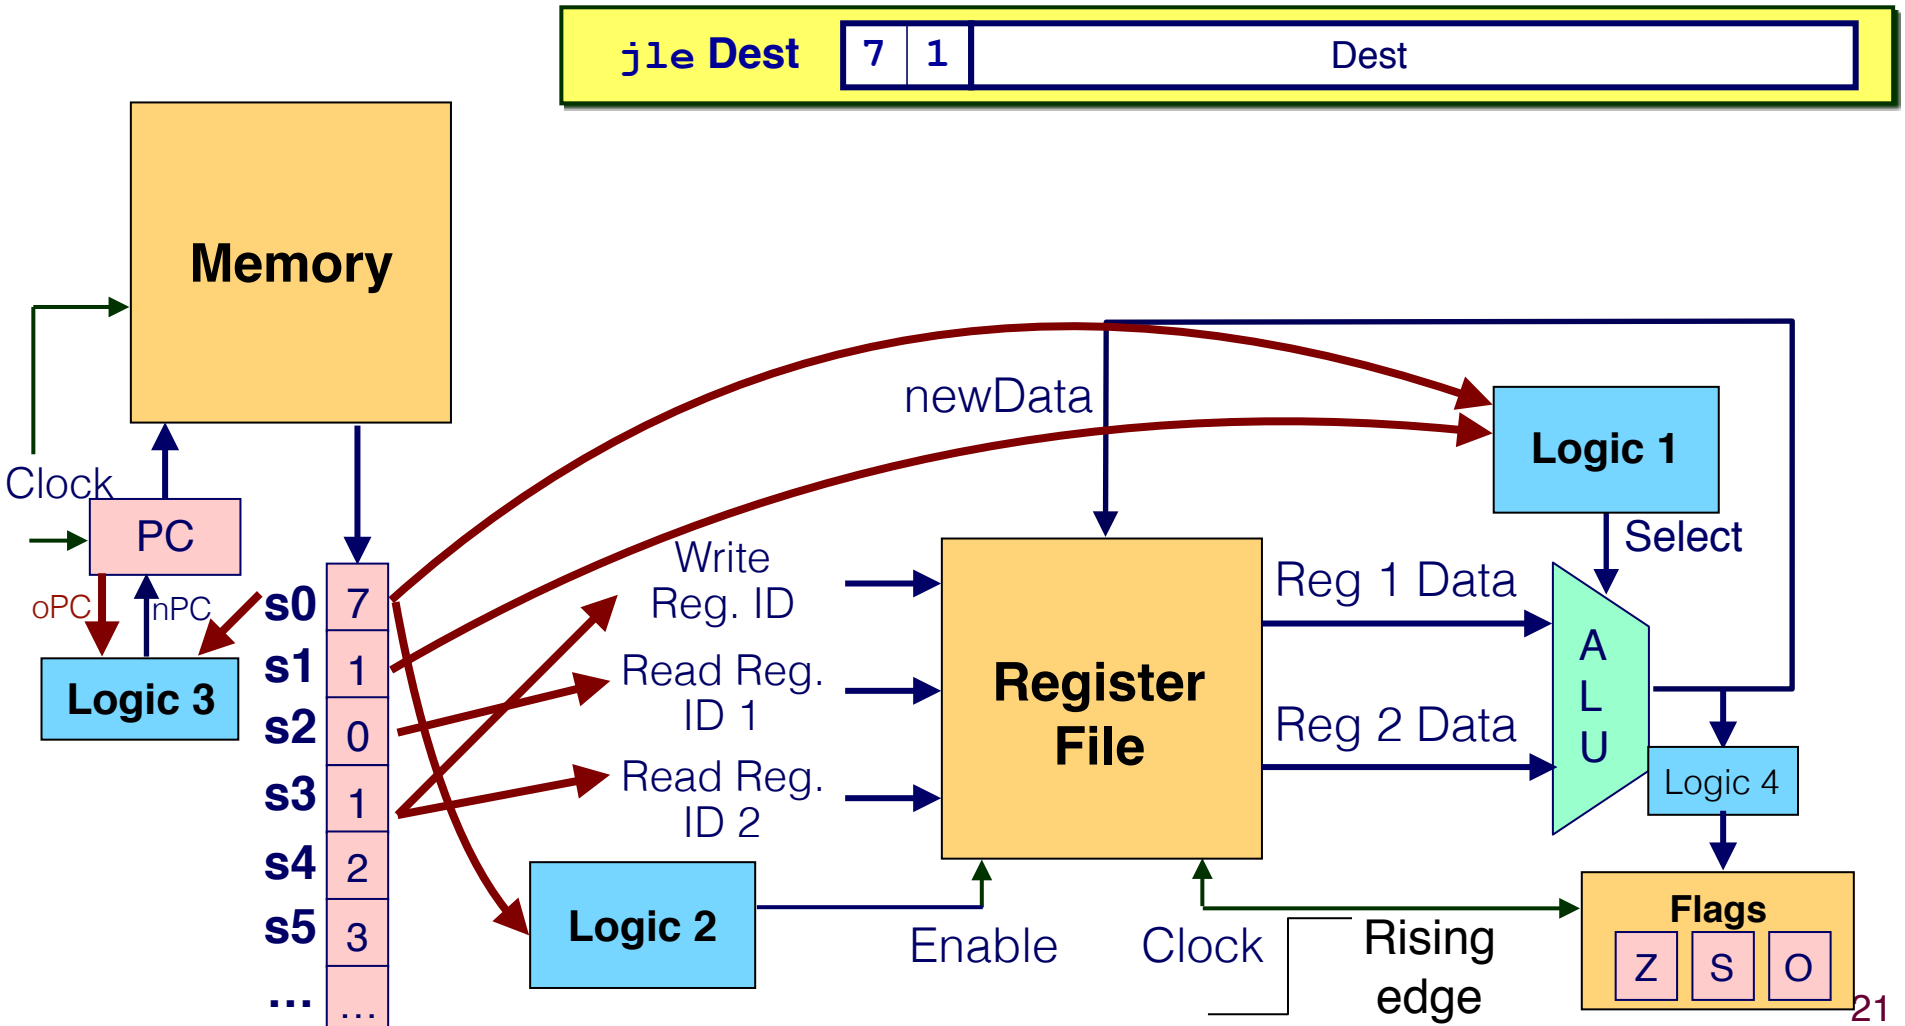
- When the rising edge of the clock arrives, the RF/PC/Flags will be written.
- So the following has to be ready: newData, nPC, which means Logic1, Logic2, Logic3, and Logic4 has to finish.

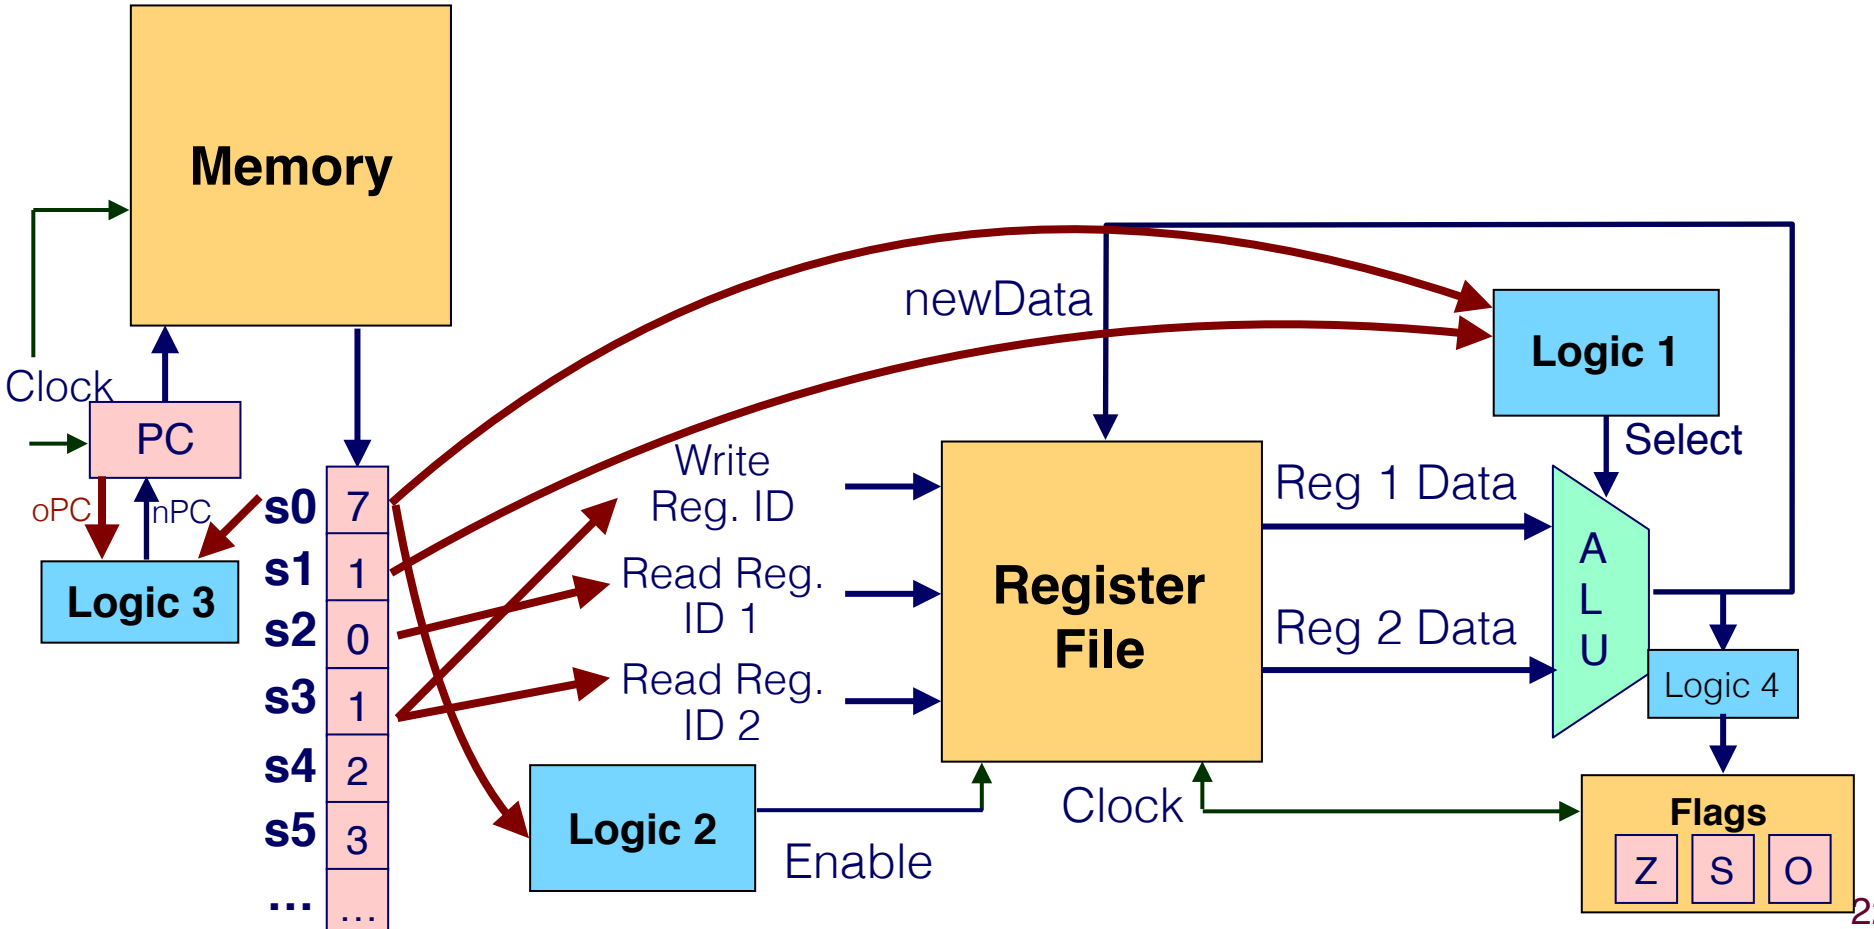


Executing a JLE instruction

- Let's say the binary encoding for `jle .L0` is `71 0123000000000000`
- What are the logics now?

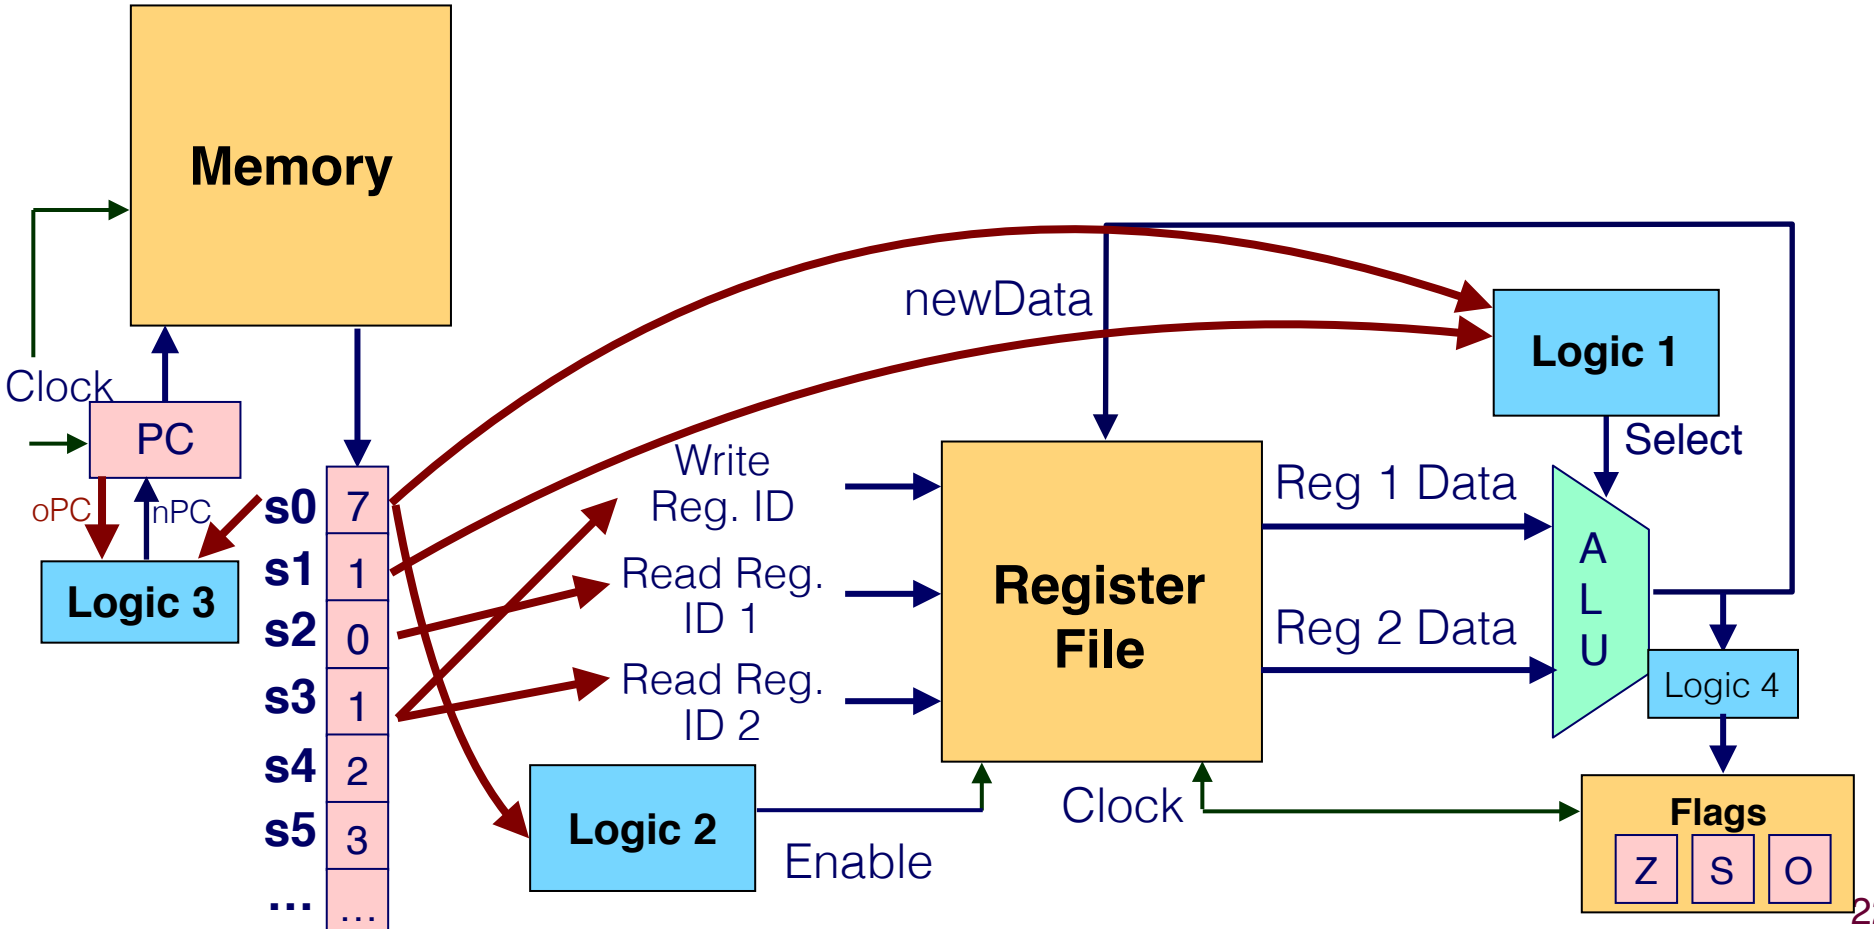


Executing a JLE instruction



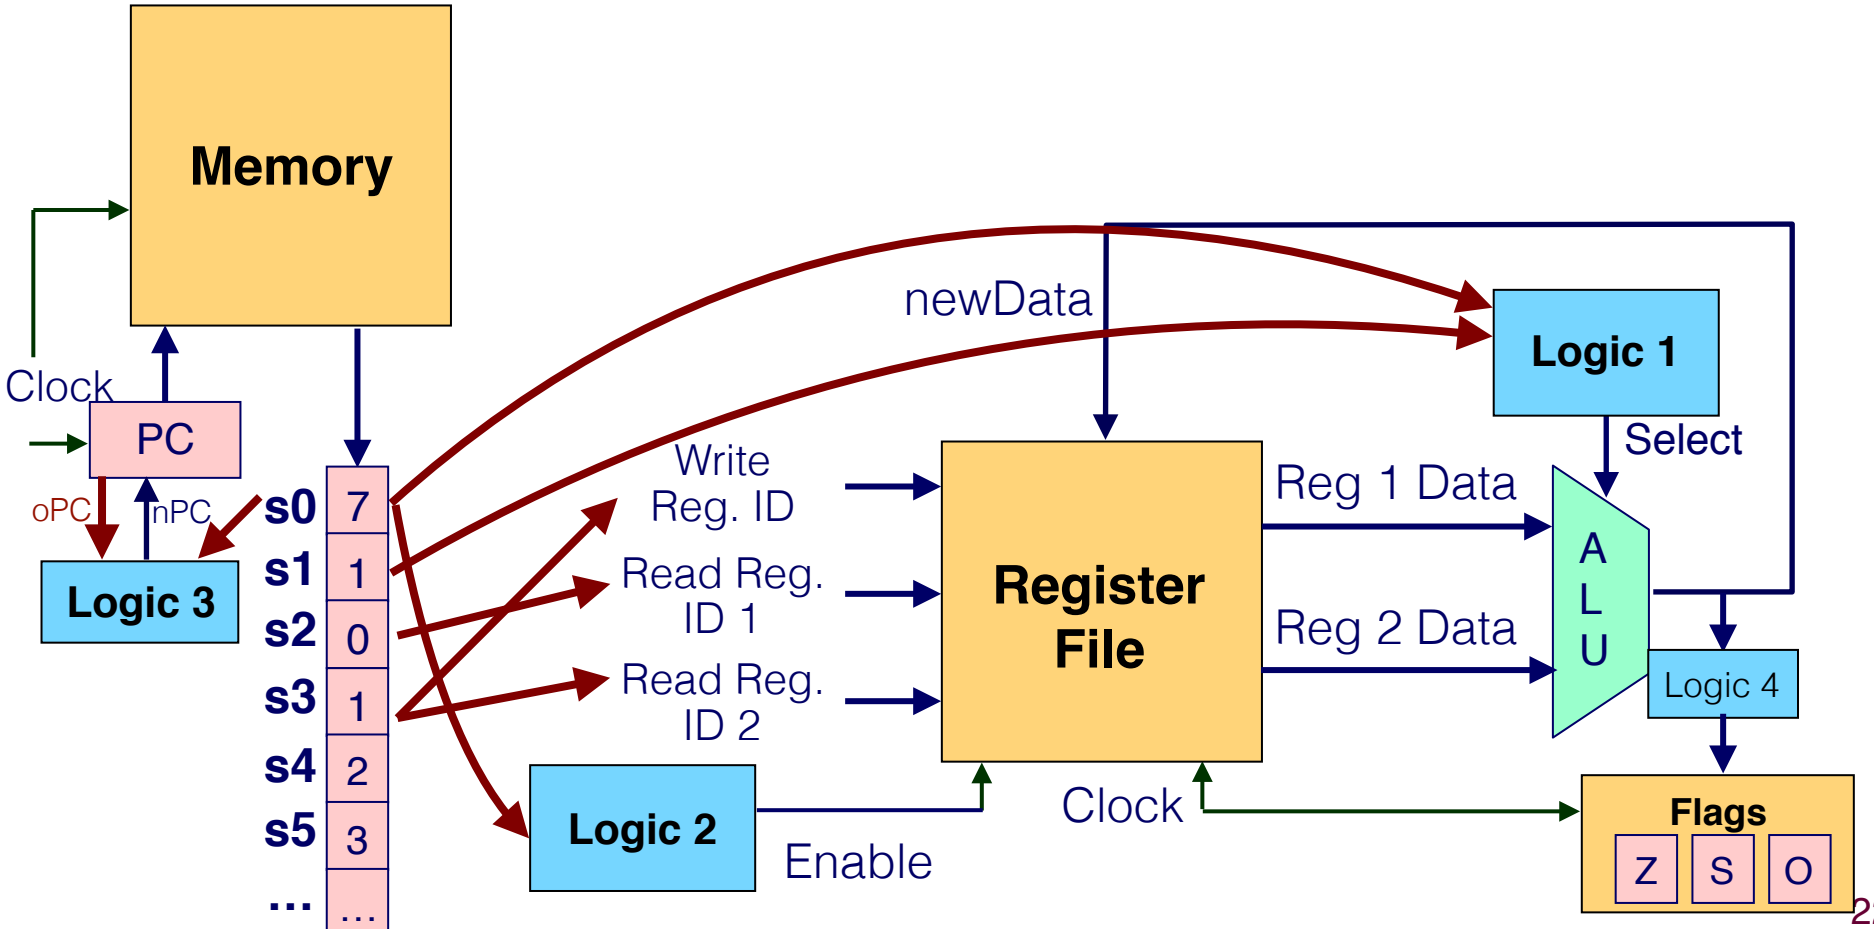
Executing a JLE instruction

- Logic 1: if (s0 == 6) select = s1;



Executing a JLE instruction

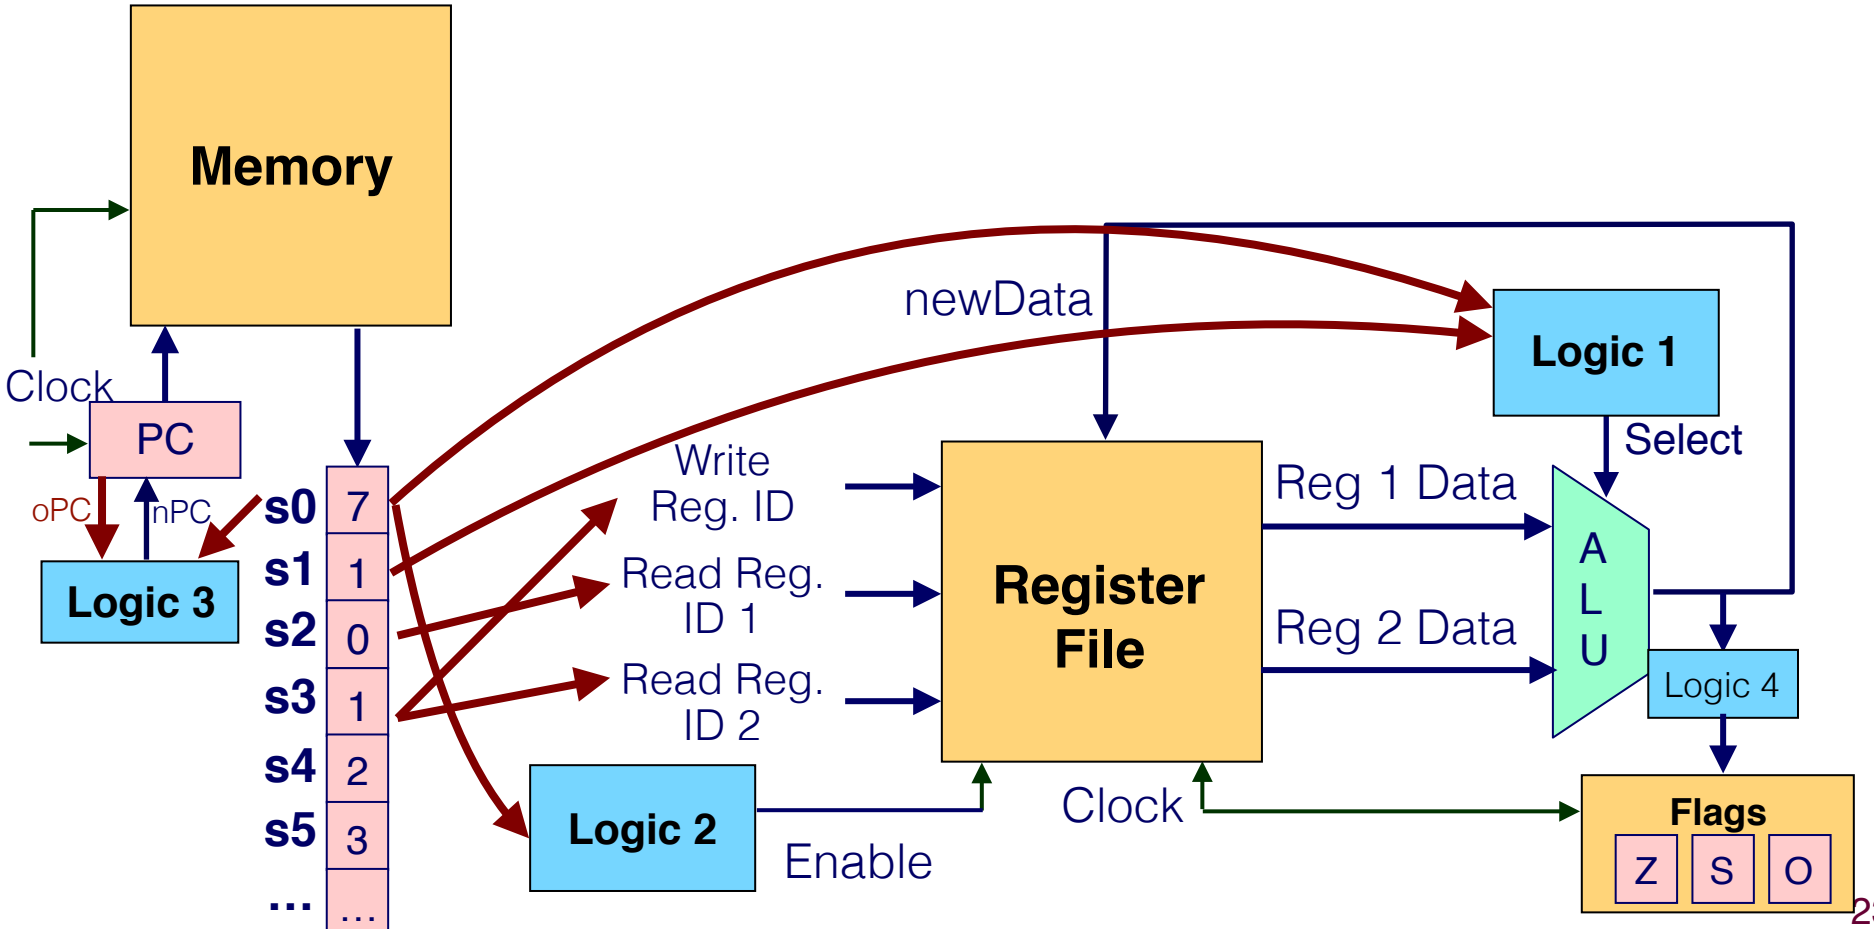
- Logic 1: if (s0 == 6) select = s1;
- Logic 2: if (s0 == 6) Enable = 1; else Enable = 0;



jle Dest	7	1	Dest

Executing a JLE instruction

- Logic 3??

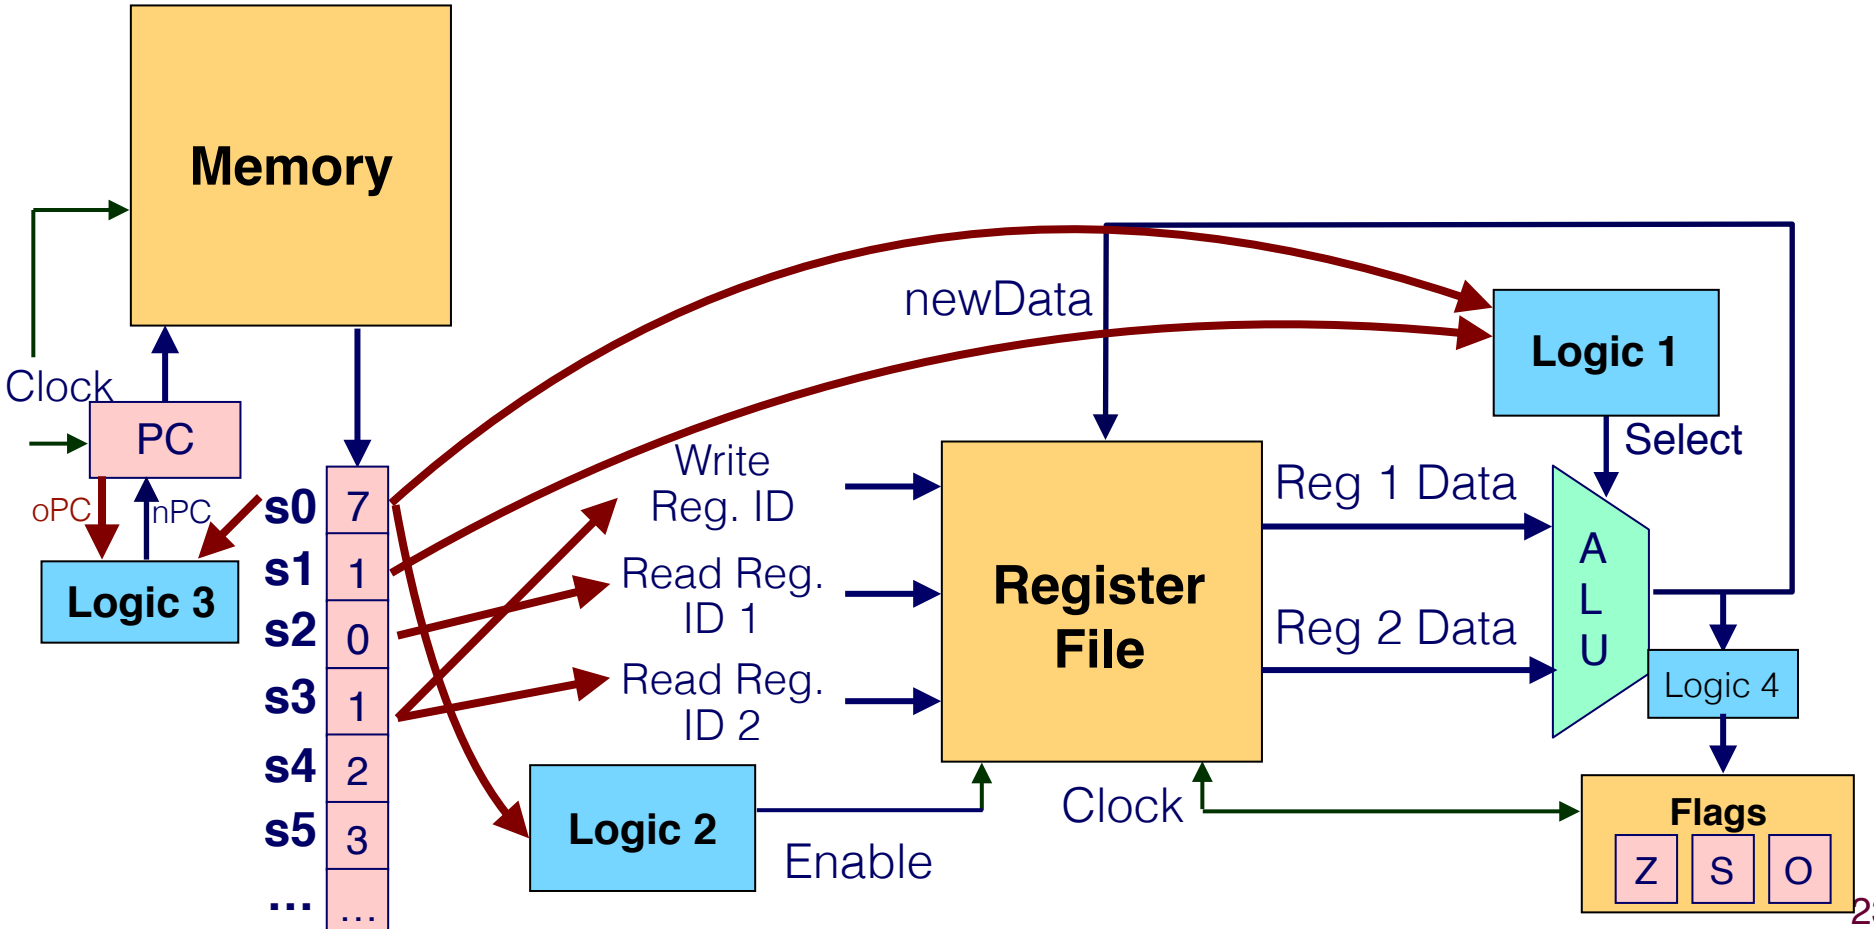


jle Dest	7	1	Dest

Executing a JLE instruction

- Logic 3??

if (s0 == 6) nPC = oPC + 2;

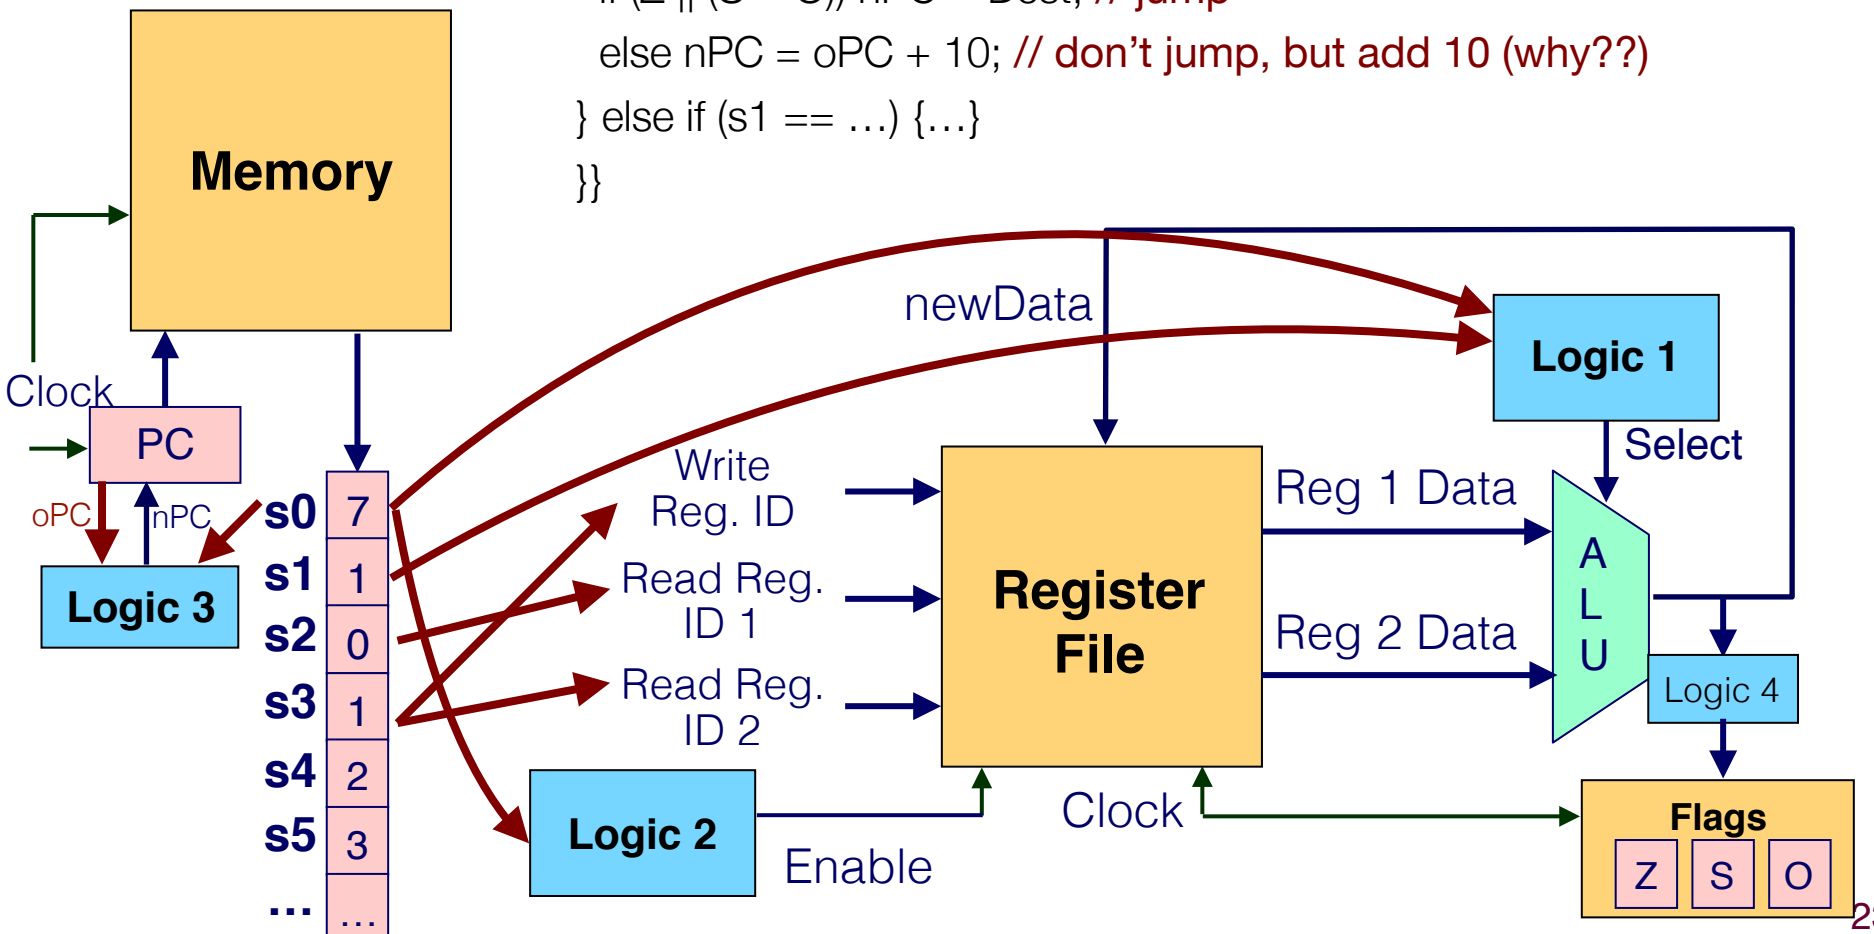


jle Dest	7	1	Dest

Executing a JLE instruction

- Logic 3??

```
if (s0 == 6) nPC = oPC + 2;
else if (s0 == 7) {
  if (s1 == 1) { // jLE
    if (Z || (S ^ O)) nPC = Dest; // jump
    else nPC = oPC + 10; // don't jump, but add 10 (why??)
  } else if (s1 == …) {…}
  }}
```

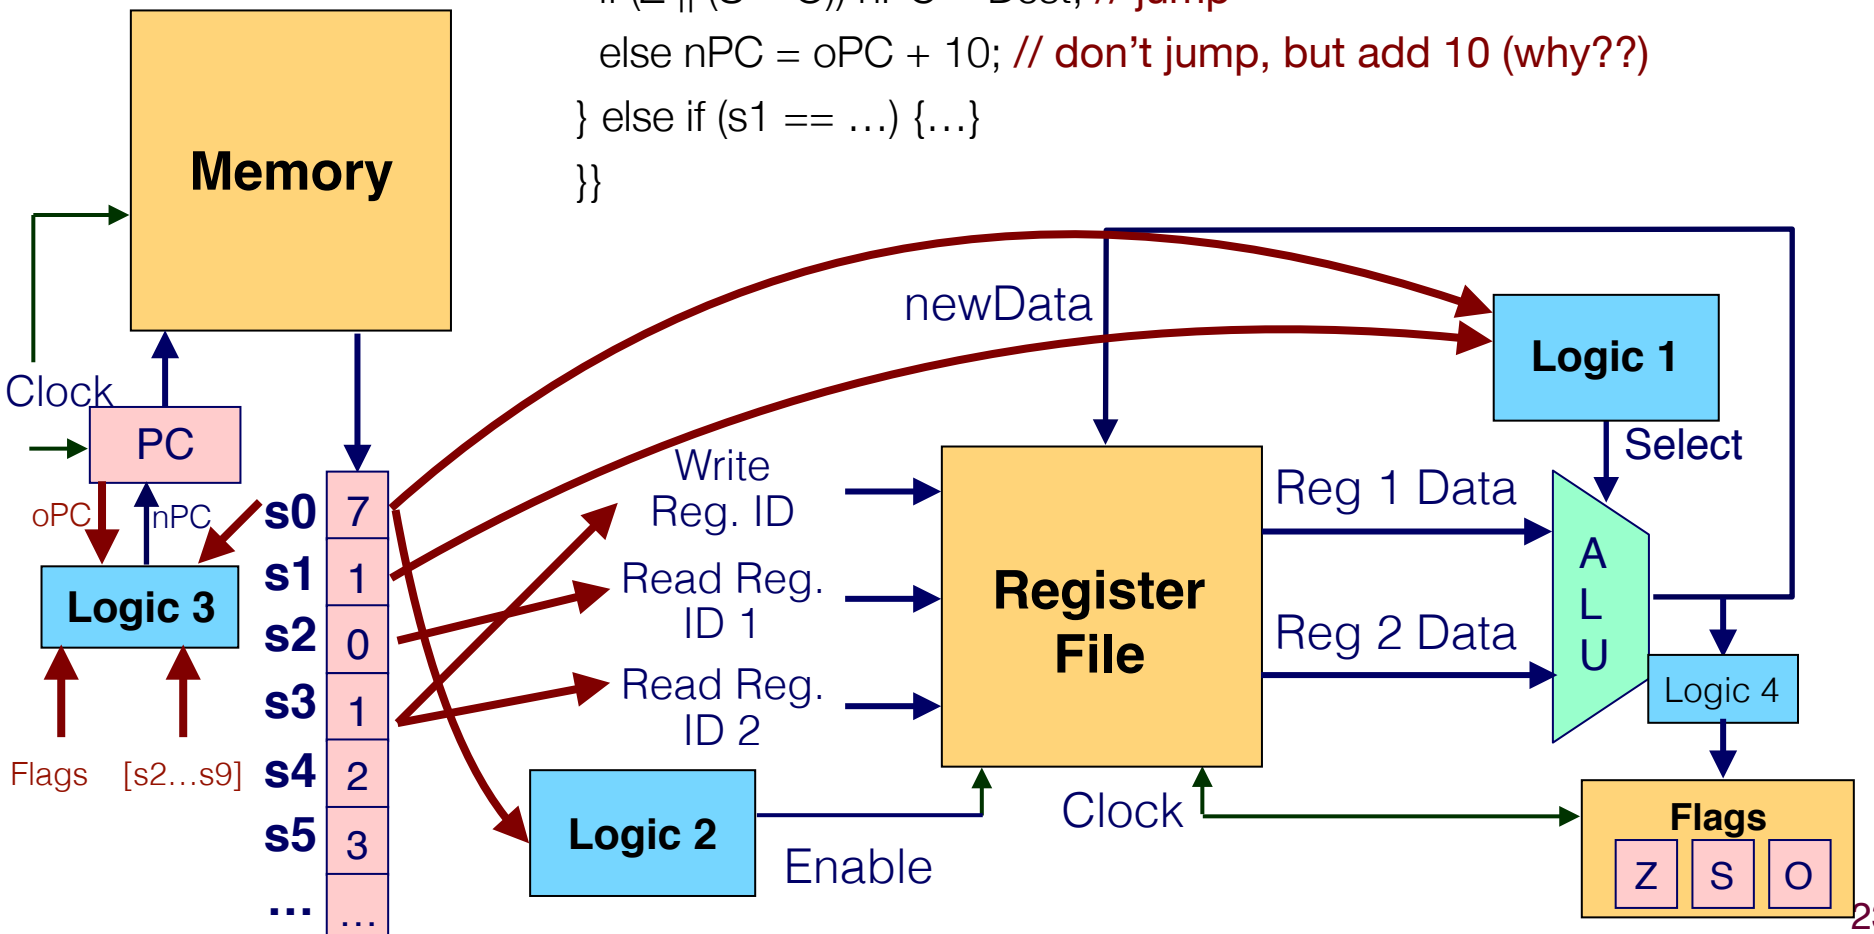


jle Dest	7	1	Dest

Executing a JLE instruction

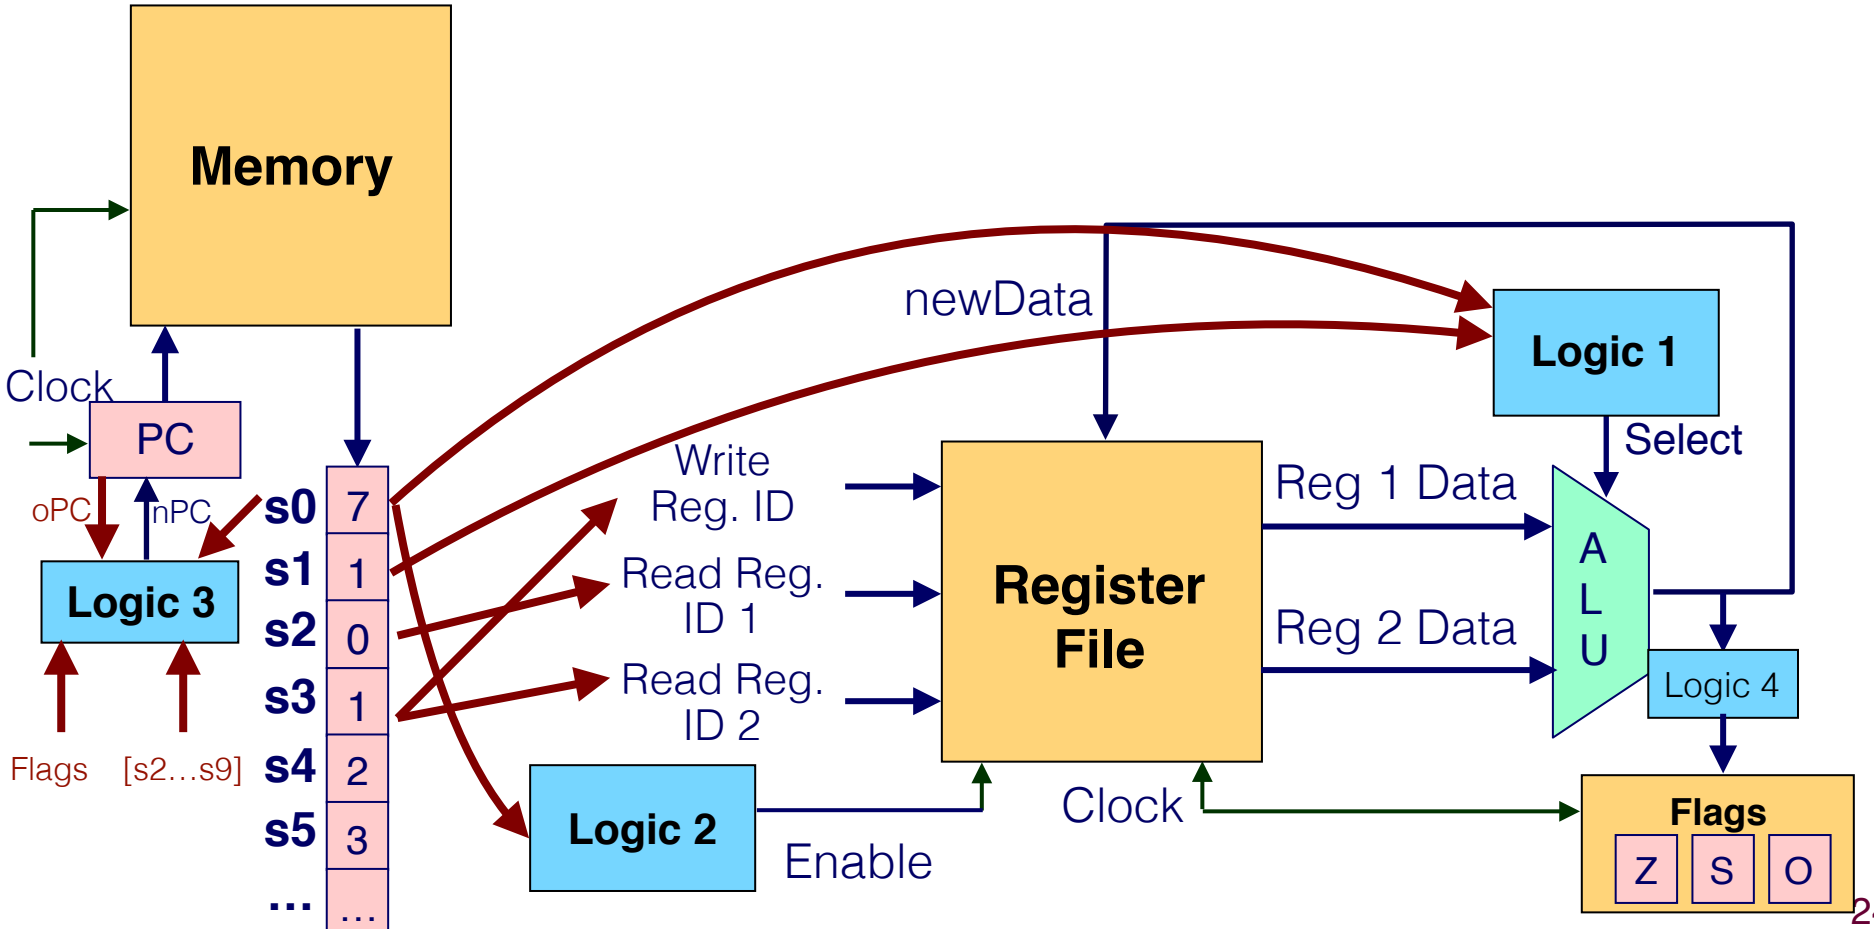
- Logic 3??

```
if (s0 == 6) nPC = oPC + 2;
else if (s0 == 7) {
  if (s1 == 1) { // jLE
    if (Z || (S ^ O)) nPC = Dest; // jump
    else nPC = oPC + 10; // don't jump, but add 10 (why??)
  } else if (s1 == …) {…}
  }}
```



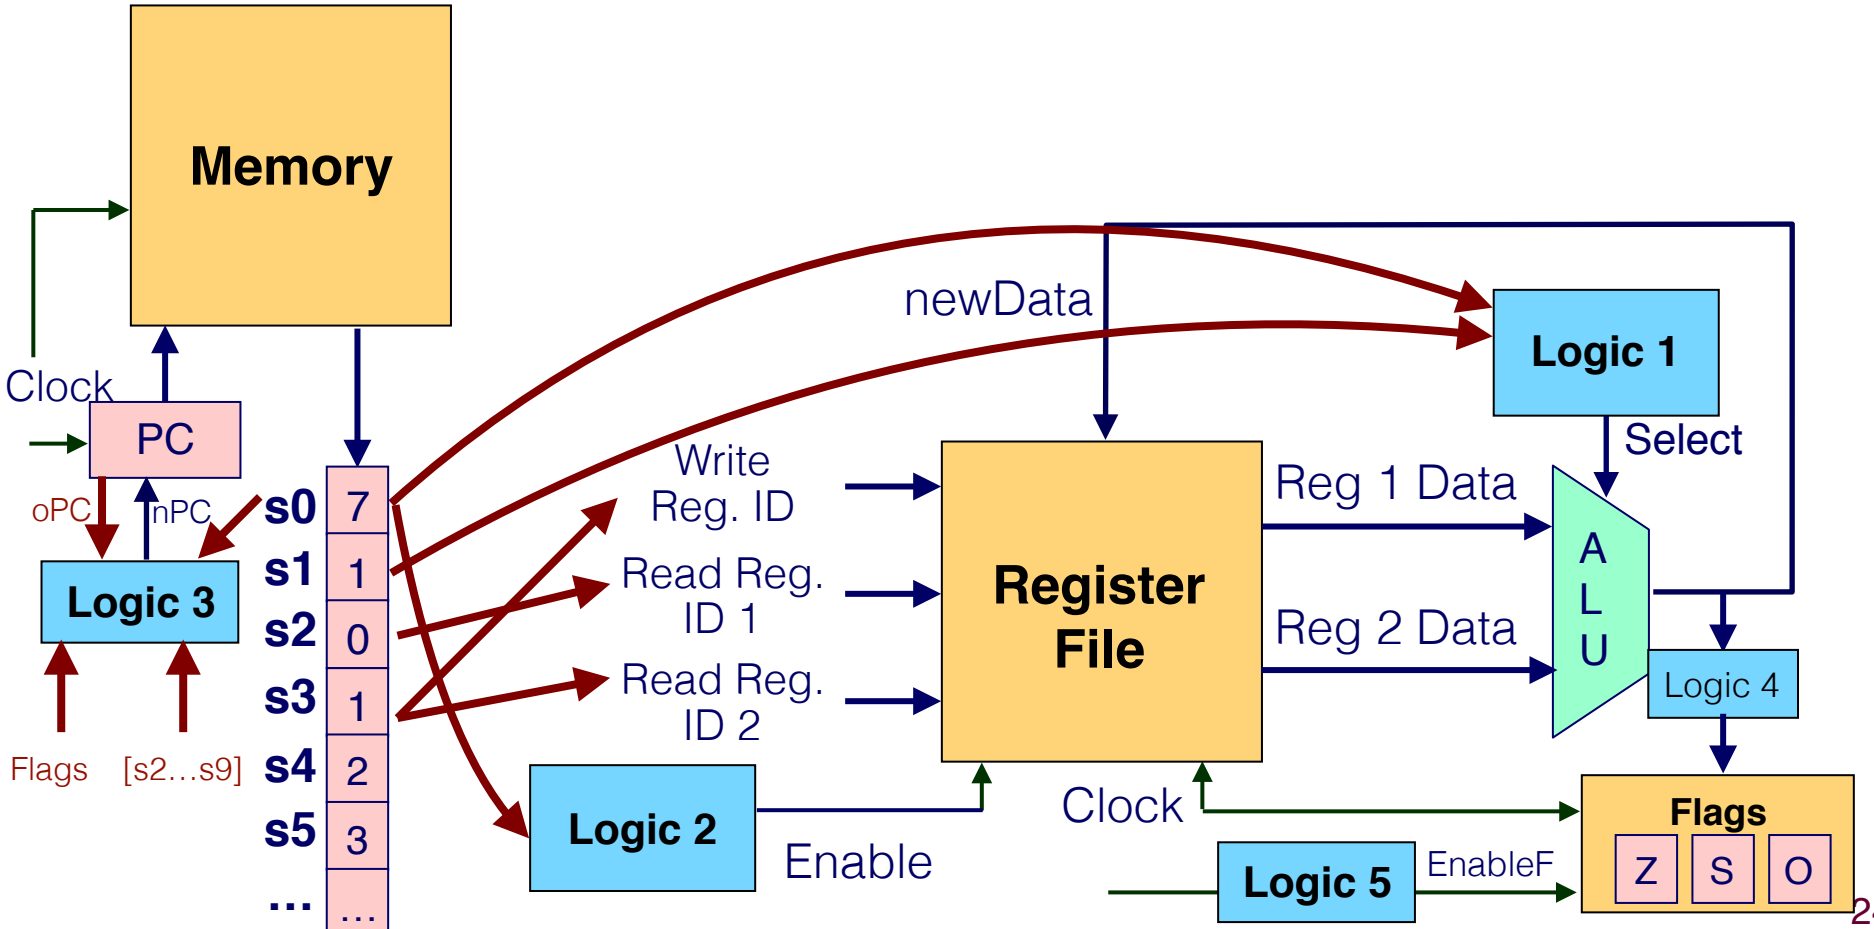
Executing a JLE instruction

- Logic 4? Does JLE write flags?



Executing a JLE instruction

- Logic 4? Does JLE write flags?
- Need another piece of logic.



Executing a JLE instruction

- Logic 4? Does JLE write flags?
- Need another piece of logic.
- Logic 5: if (s0 == 7) EnableF = 0; else if (s0 == 6) EnableF = 1;

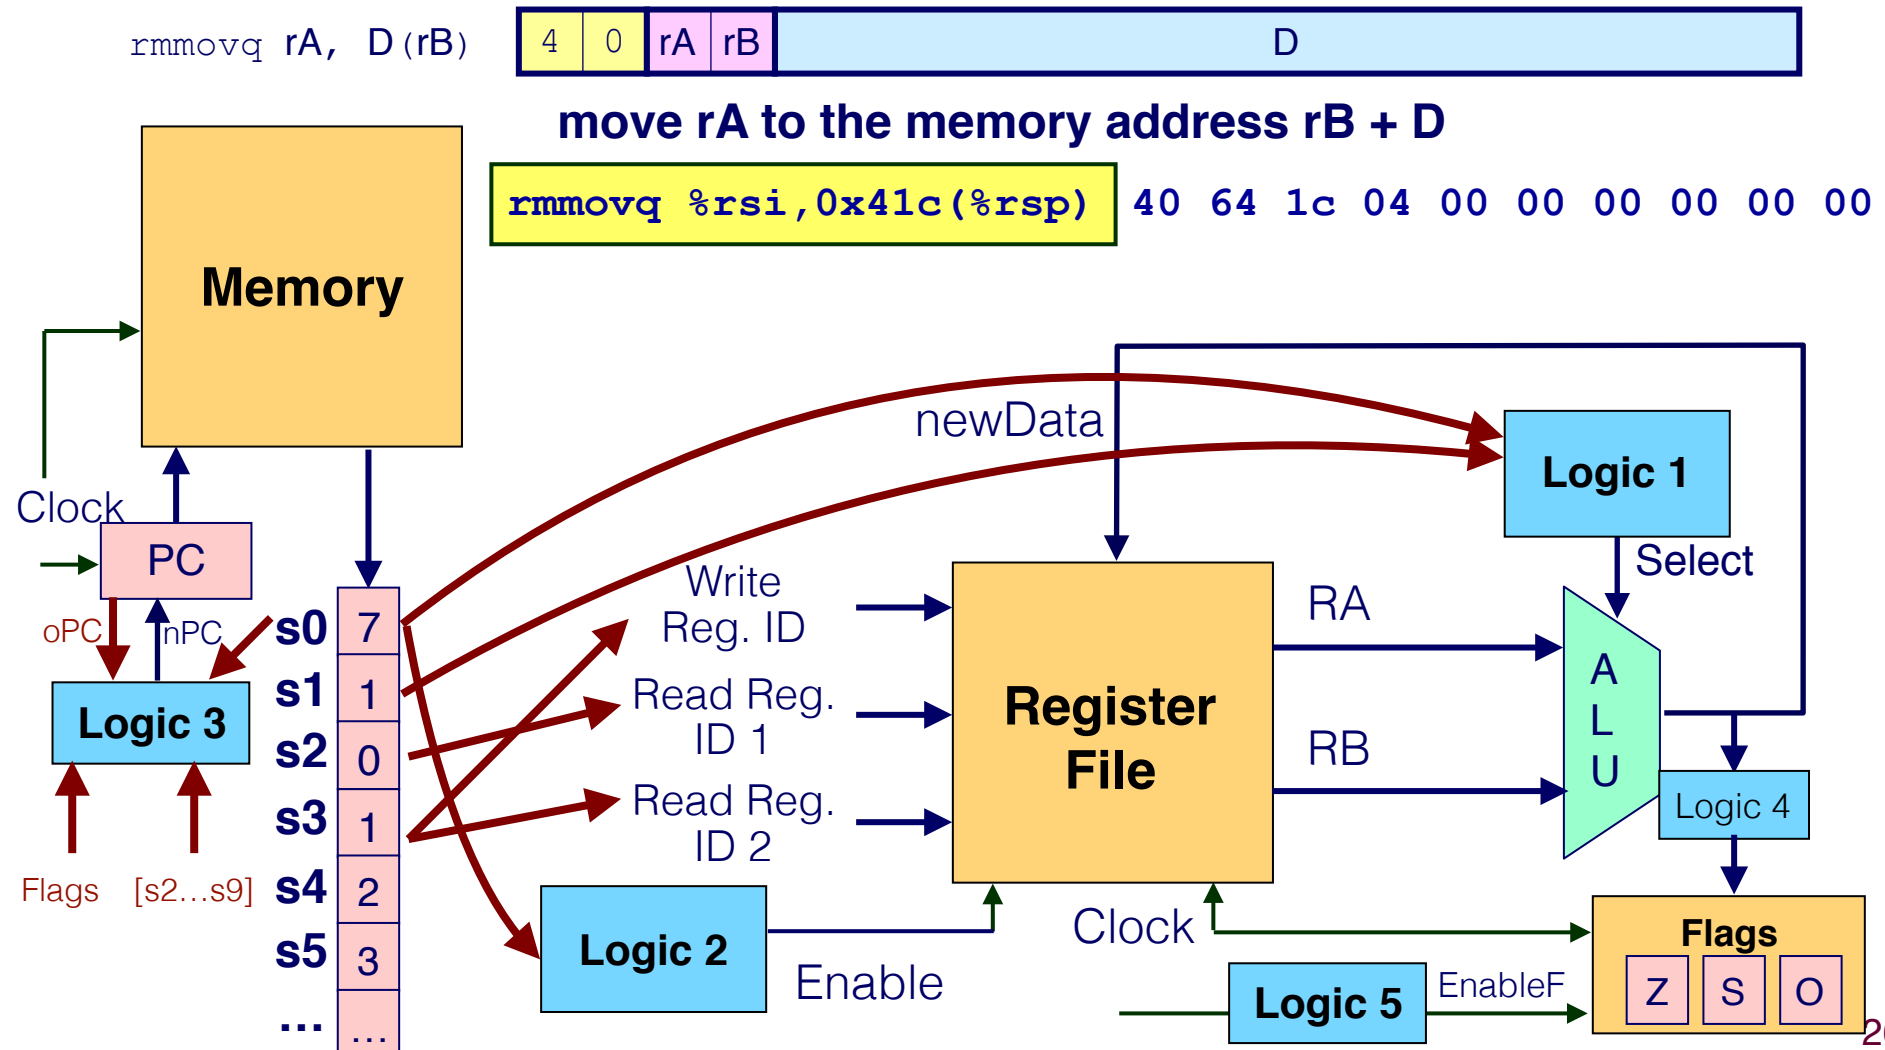
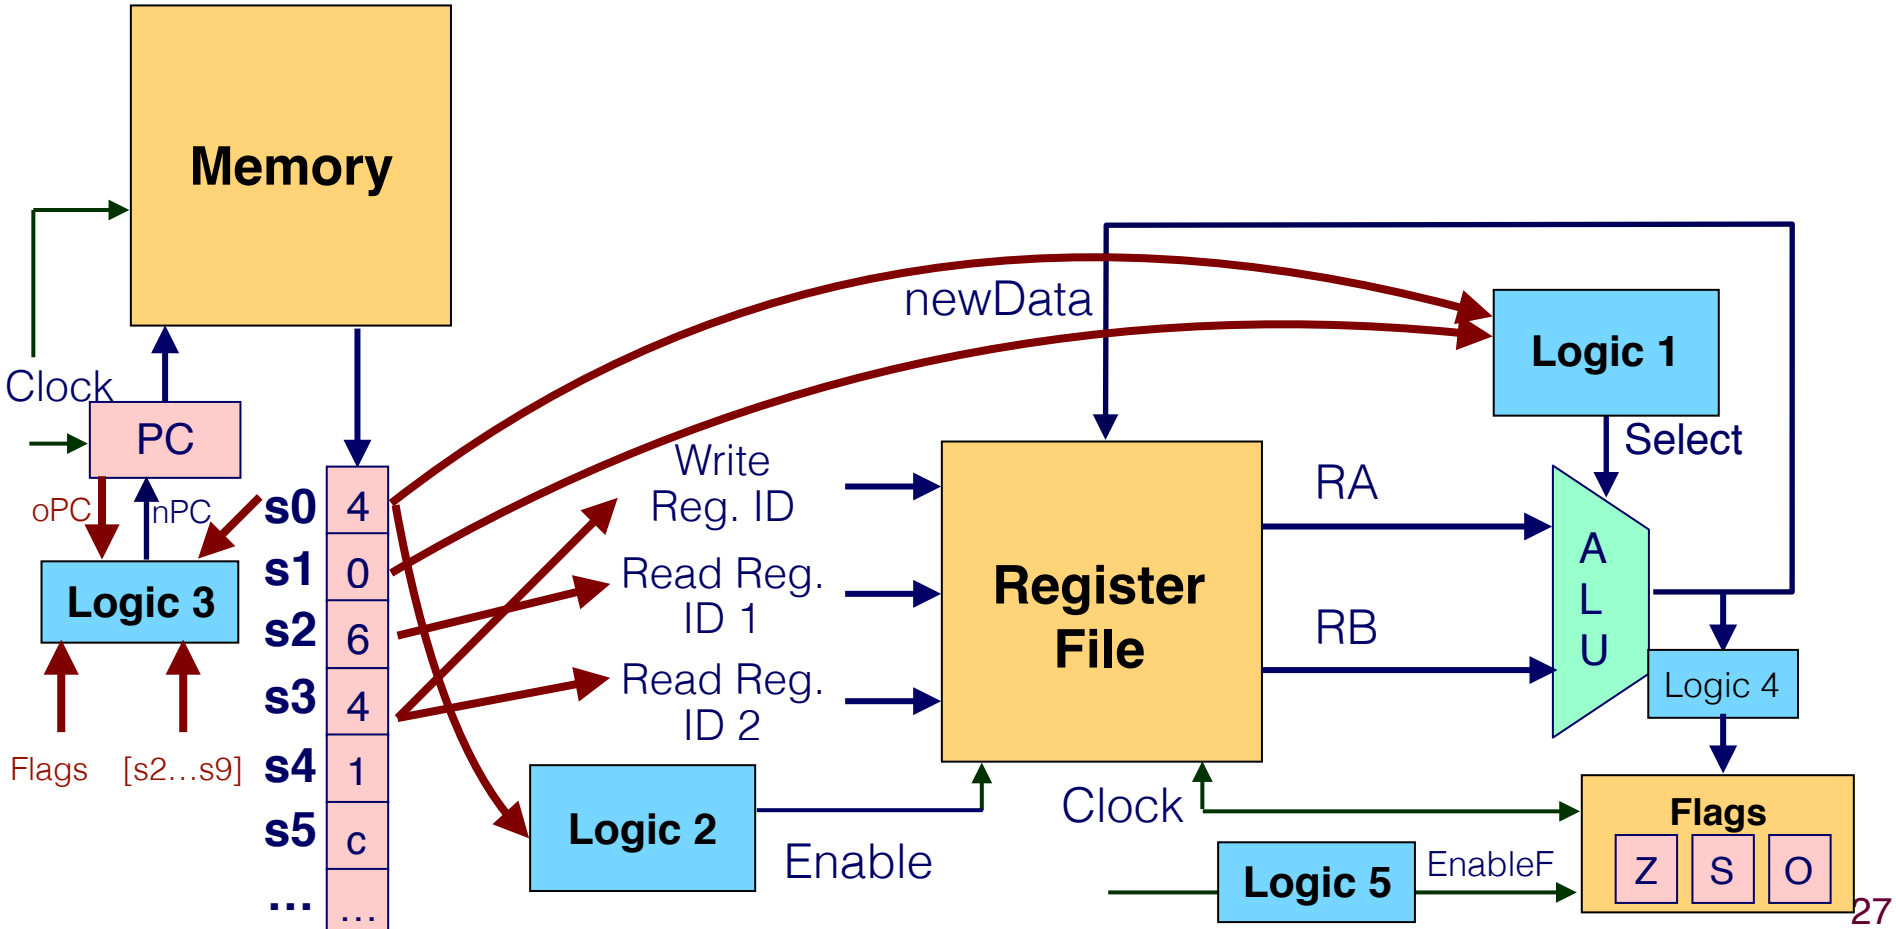
Executing a MOV instruction

- How do we modify the hardware to execute a move instruction?



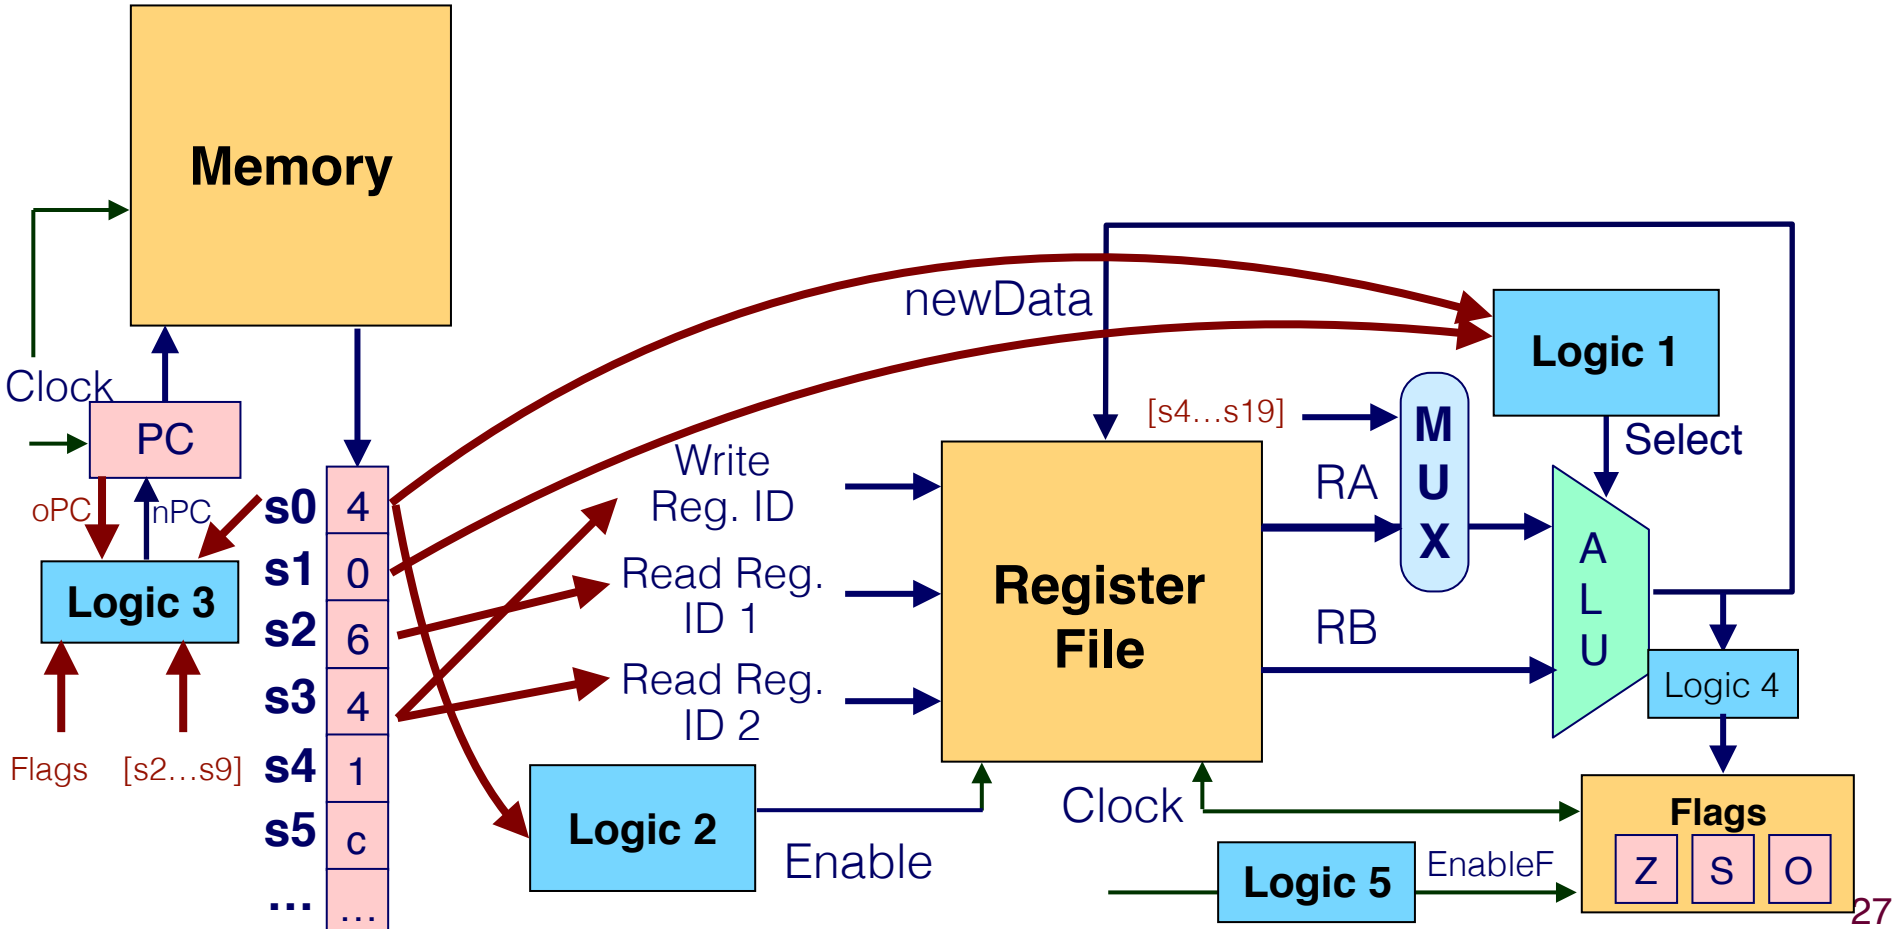
move rA to the memory address rB + D

`rmmovq rA, D(rB)`



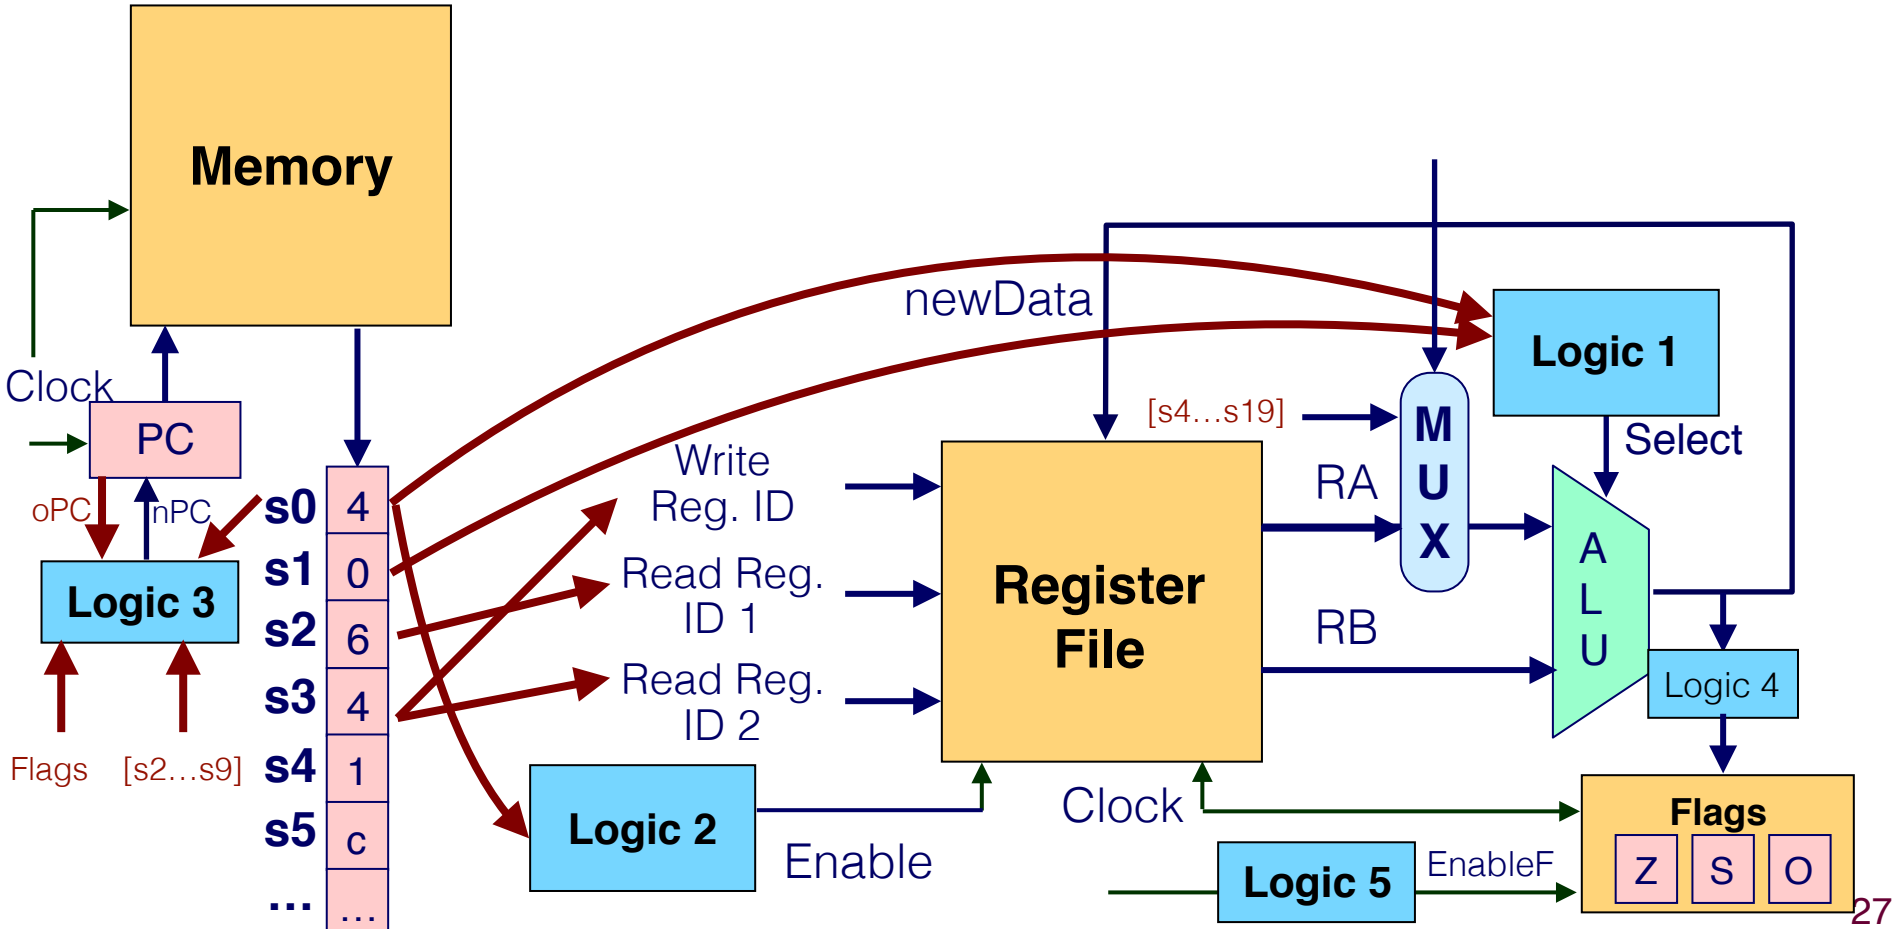
move rA to the memory address rB + D

`rmmovq rA, D(rB)`



move rA to the memory address rB + D

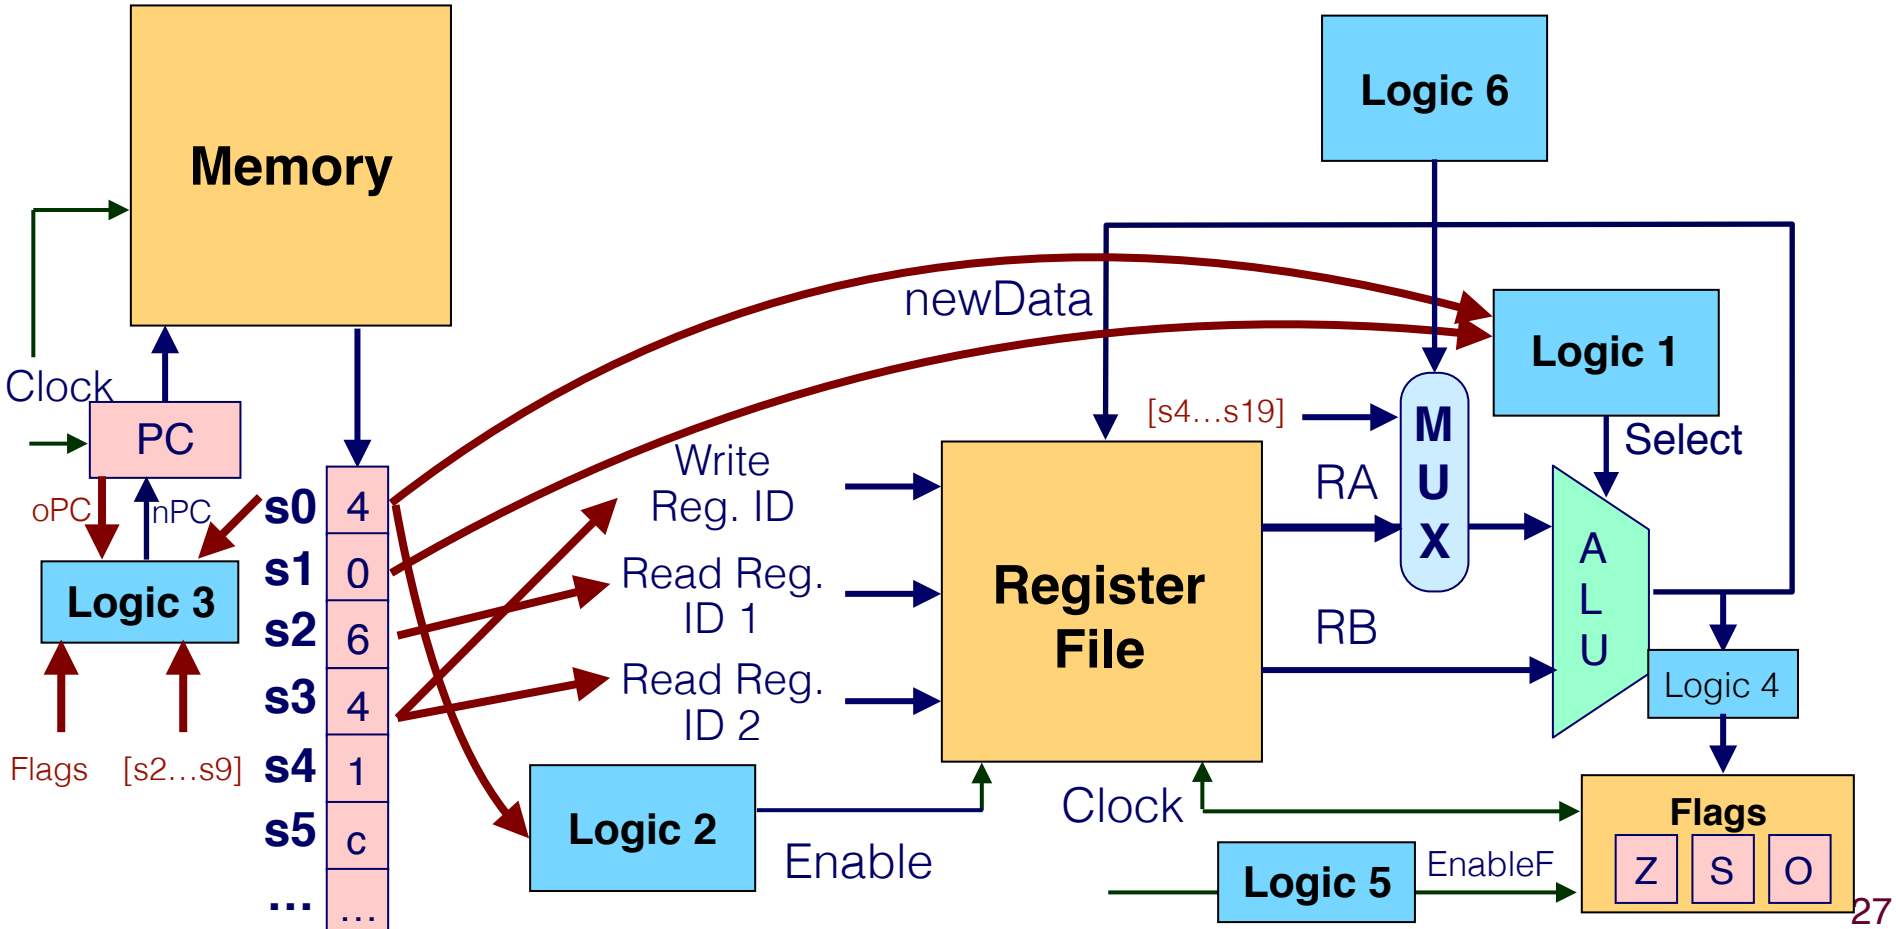
`rmmovq rA, D(rB)`



move rA to the memory address rB + D

`rmmovq rA, D(rB)`

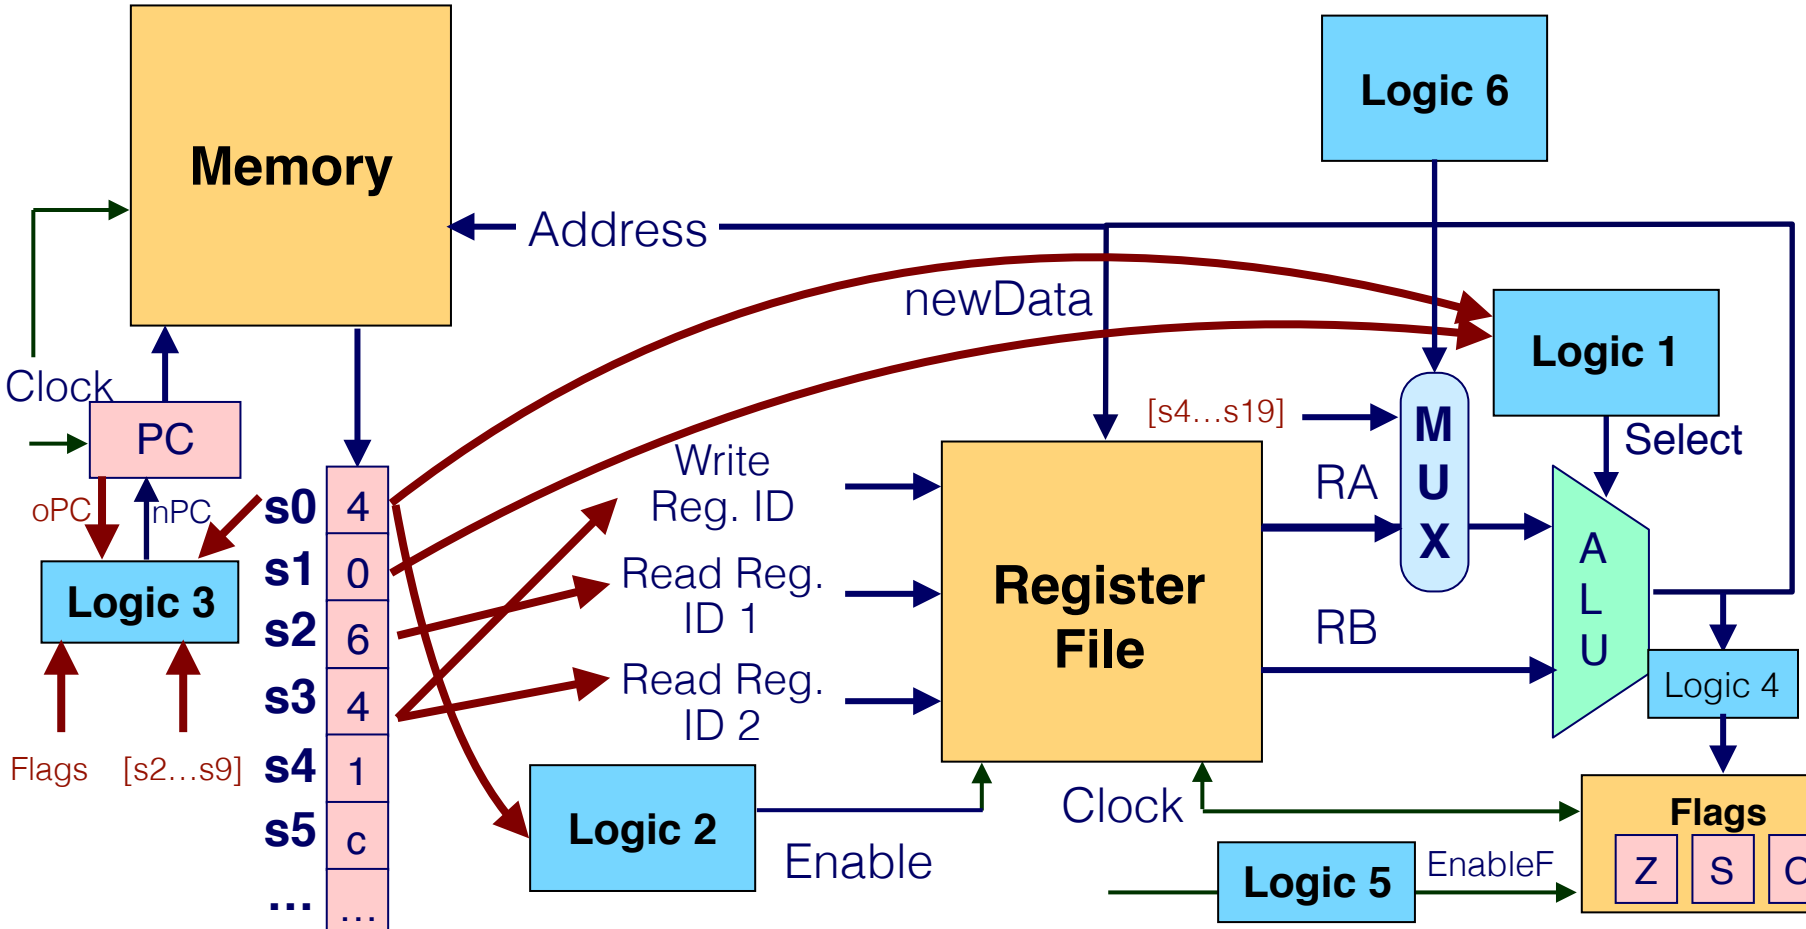
- Need new logic (Logic 6) to select the input to the ALU for Enable.



move rA to the memory address rB + D

`rmmovq rA, D(rB)`

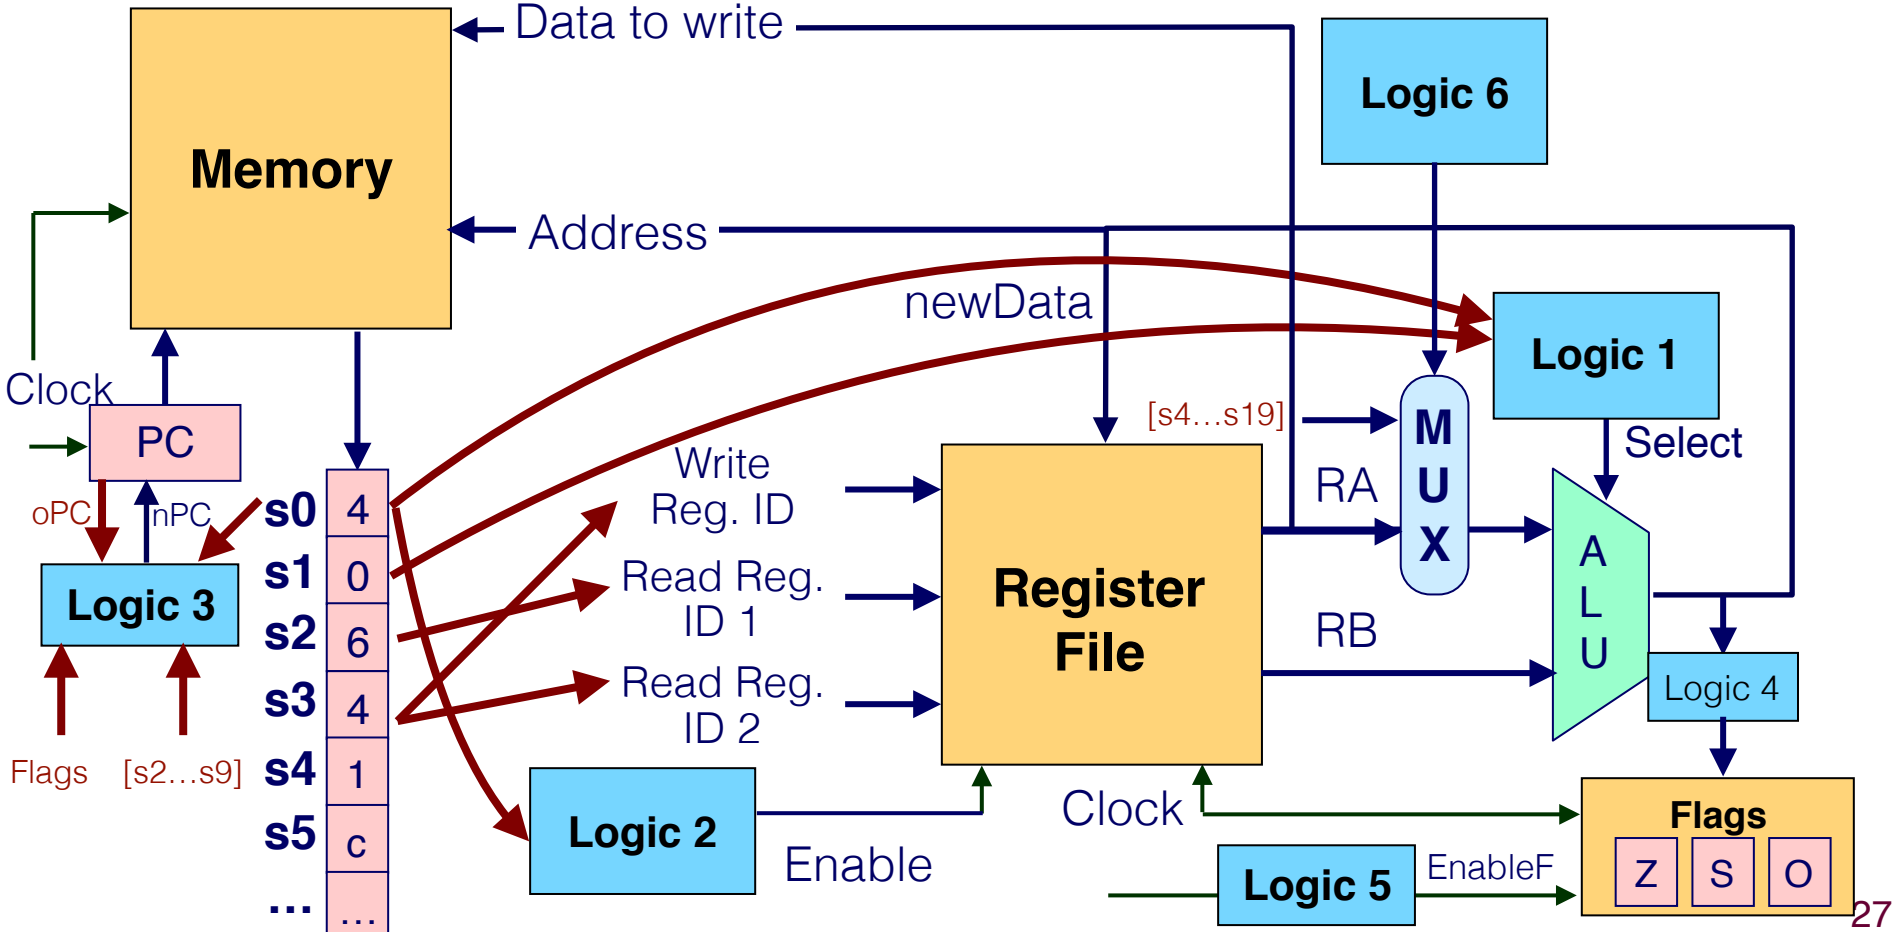
- Need new logic (Logic 6) to select the input to the ALU for Enable.



move rA to the memory address rB + D

`rmmovq rA, D(rB)`

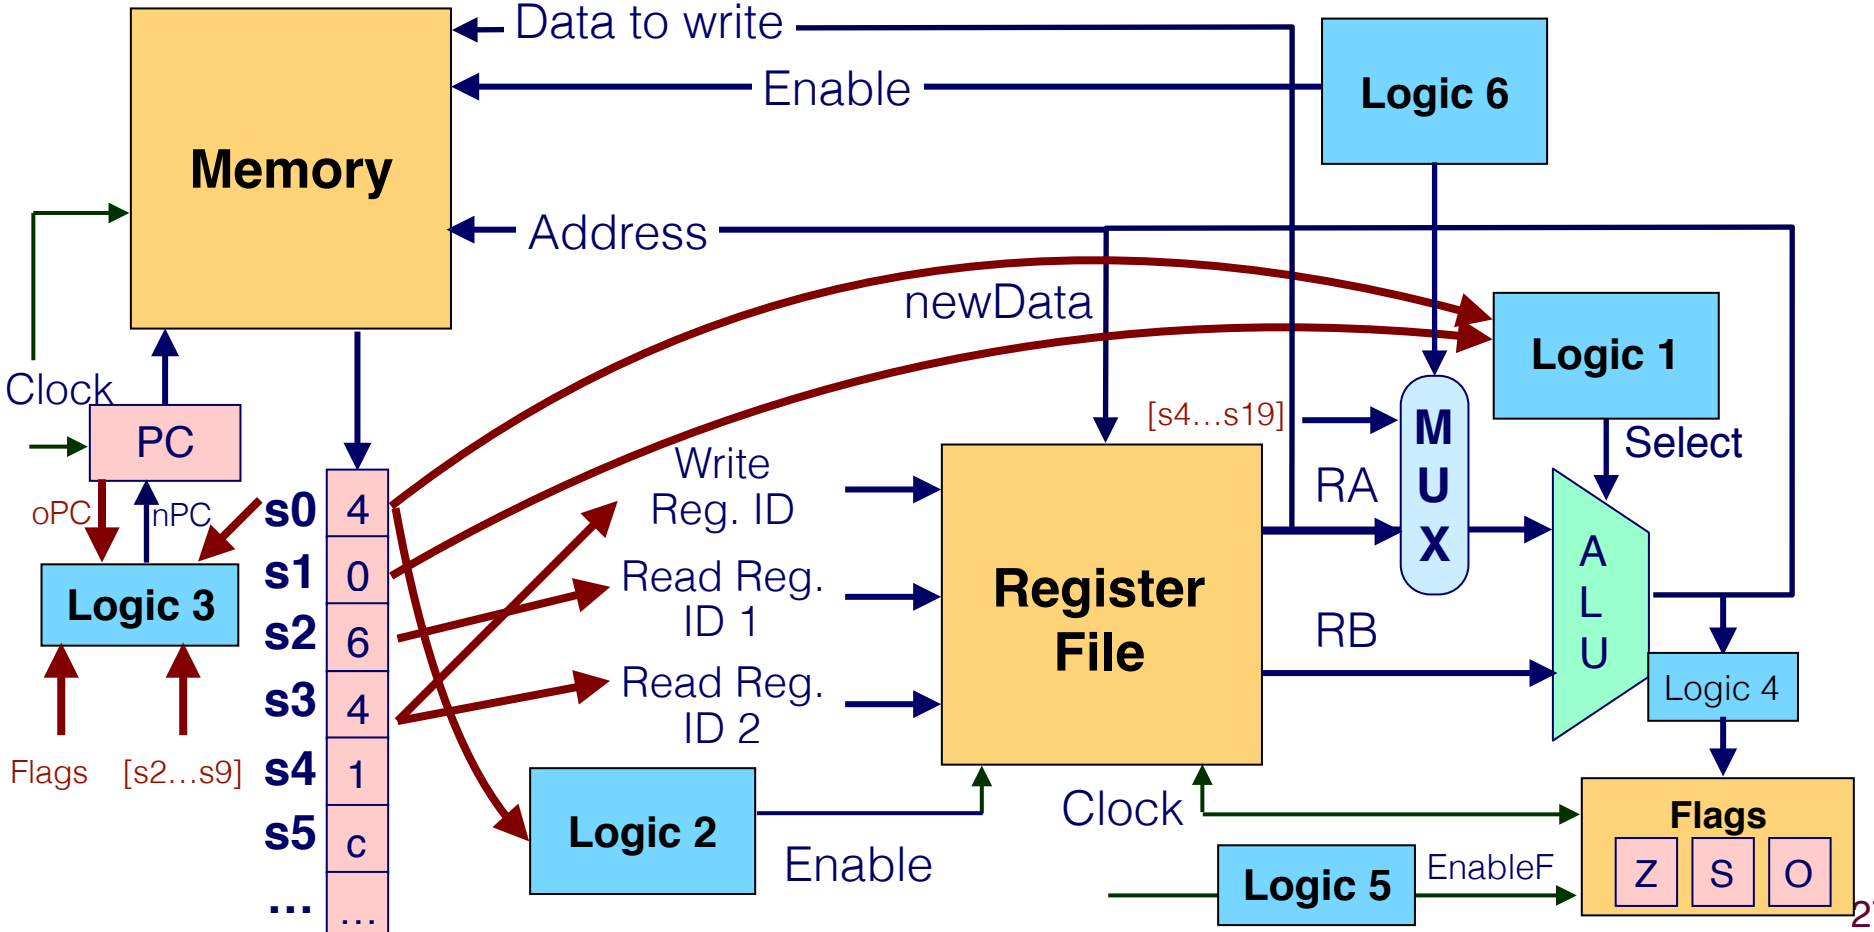
- Need new logic (Logic 6) to select the input to the ALU for Enable.



move rA to the memory address rB + D

`rmmovq rA, D(rB)`

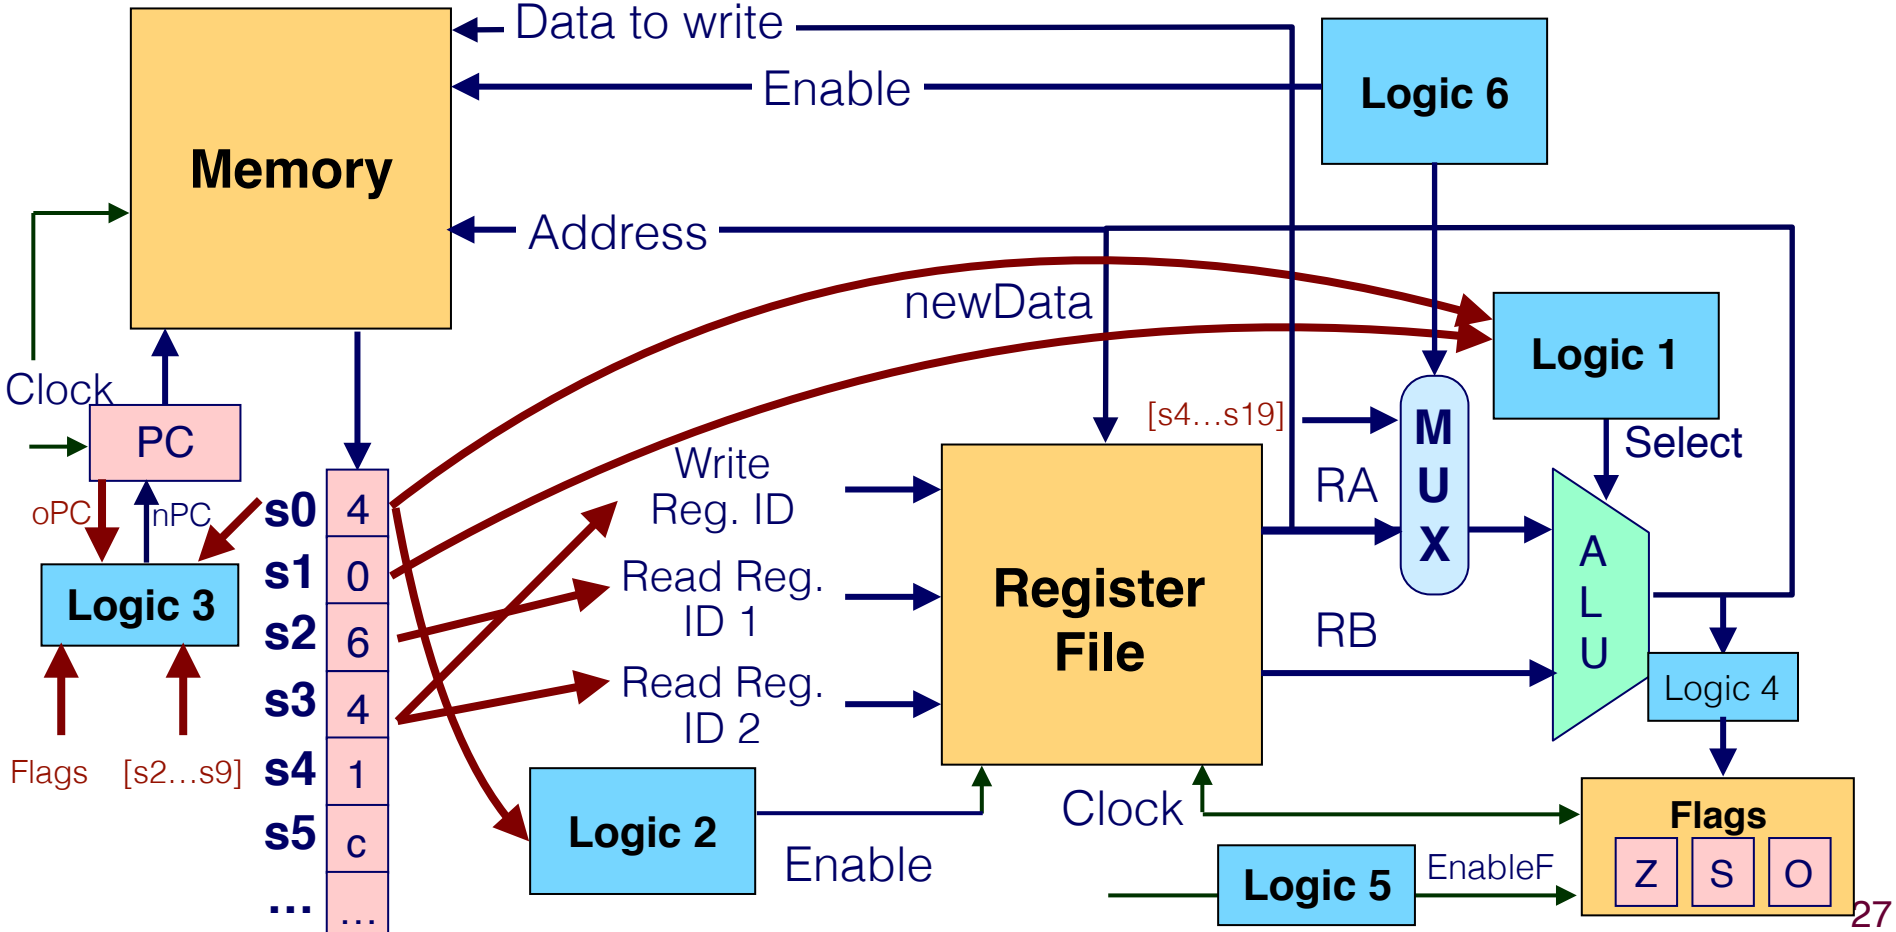
- Need new logic (Logic 6) to select the input to the ALU for Enable.



move rA to the memory address rB + D

`rmmovq rA, D(rB)`

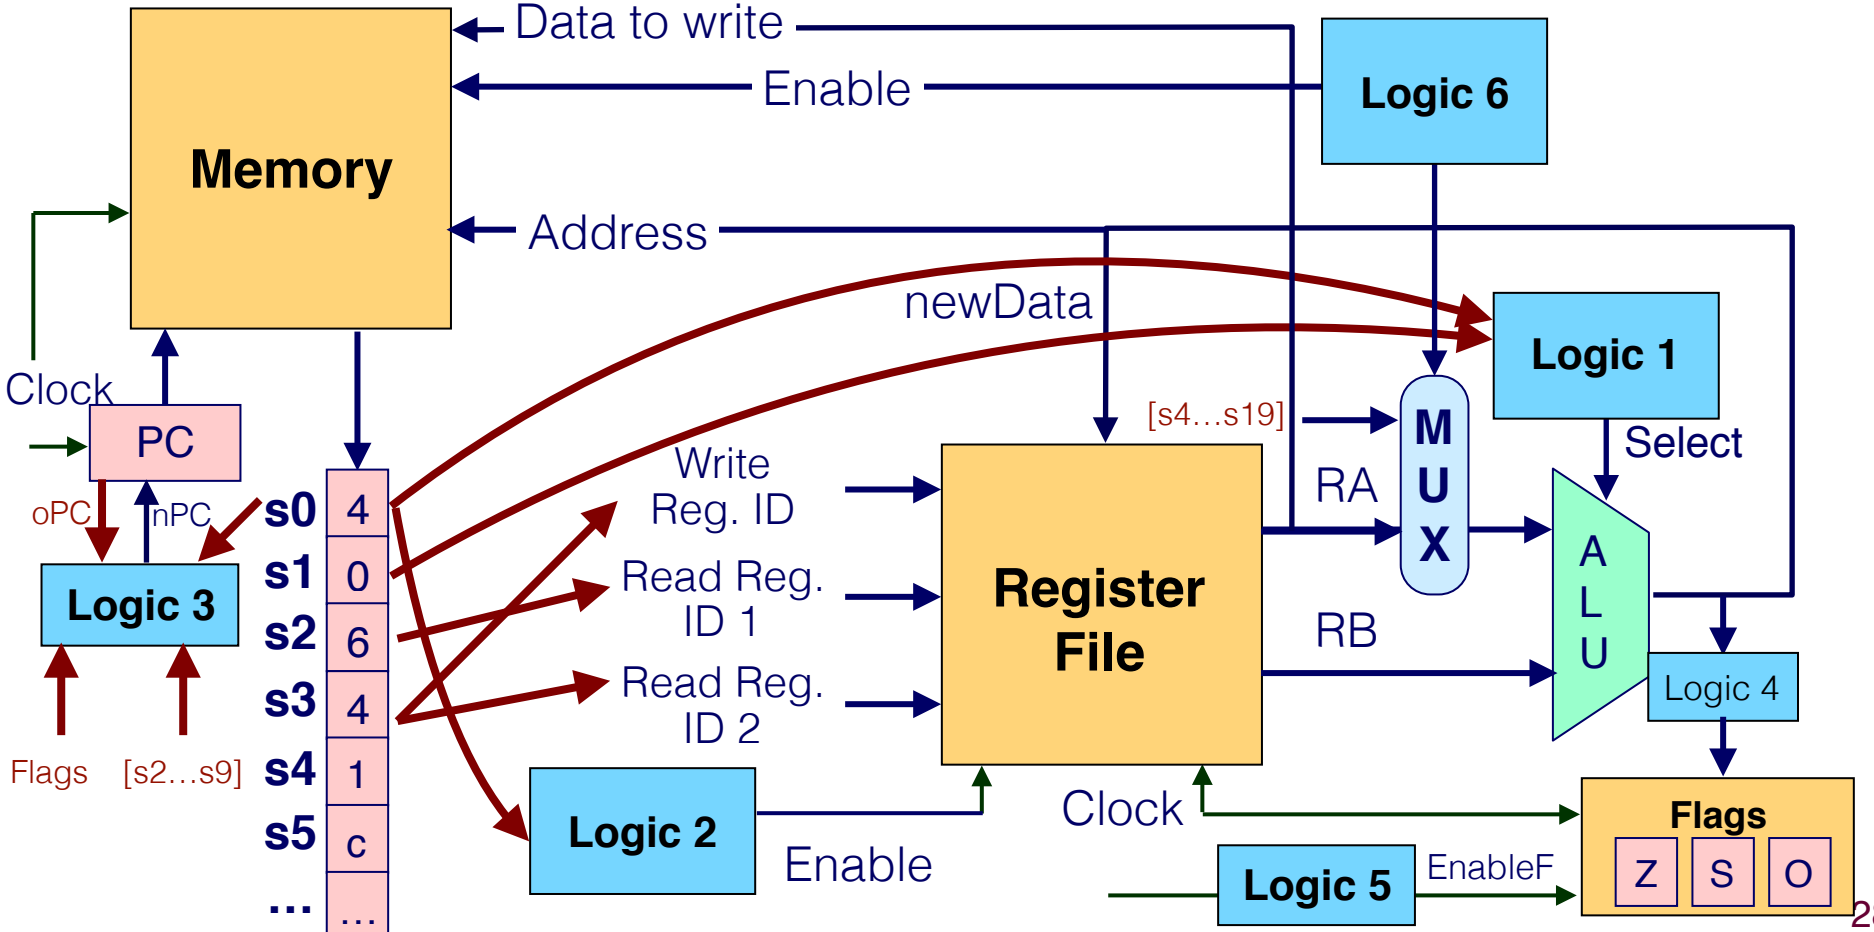
- Need new logic (Logic 6) to select the input to the ALU for Enable.
- How about other logics?



How About Memory to Register MOV?

move data at memory address rB + D to rA

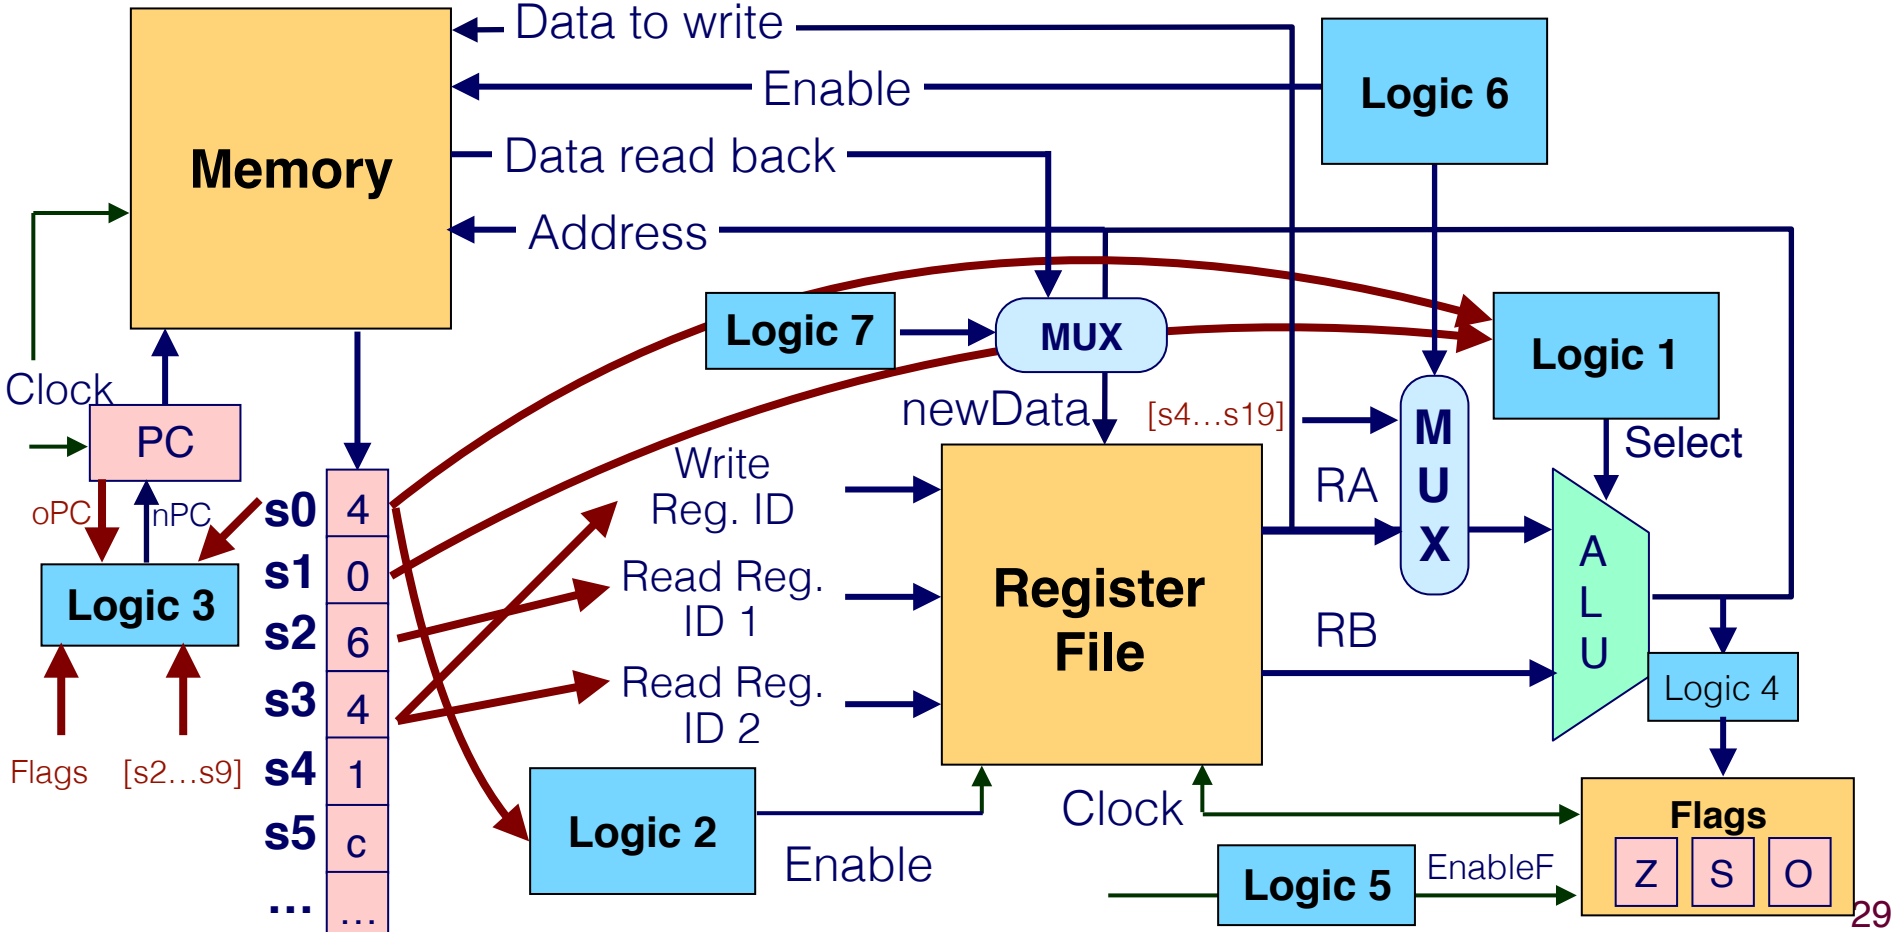
`mrmovq D(rB), rA`



How About Memory to Register MOV?

move data at memory address rB + D to rA

`mrmovq D(rB), rA`



Microarchitecture (with MOV)

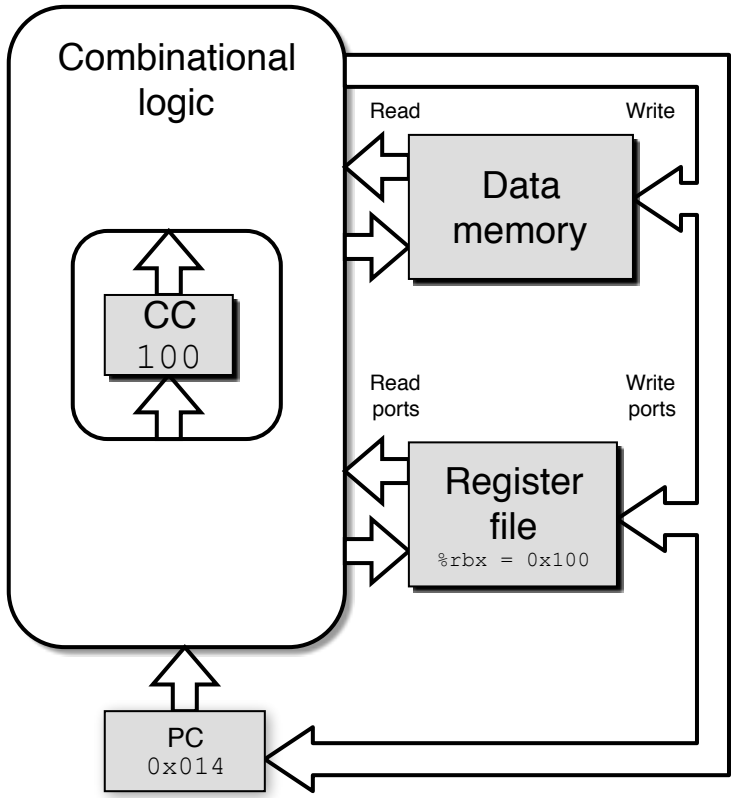
Microarchitecture Overview

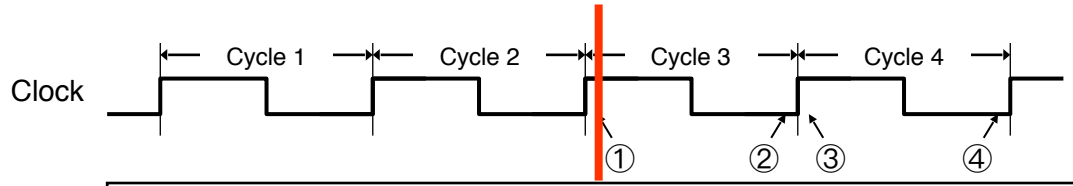
Think of it as a state machine

Every cycle, one instruction gets executed. At the end of the cycle, architecture states get modified.

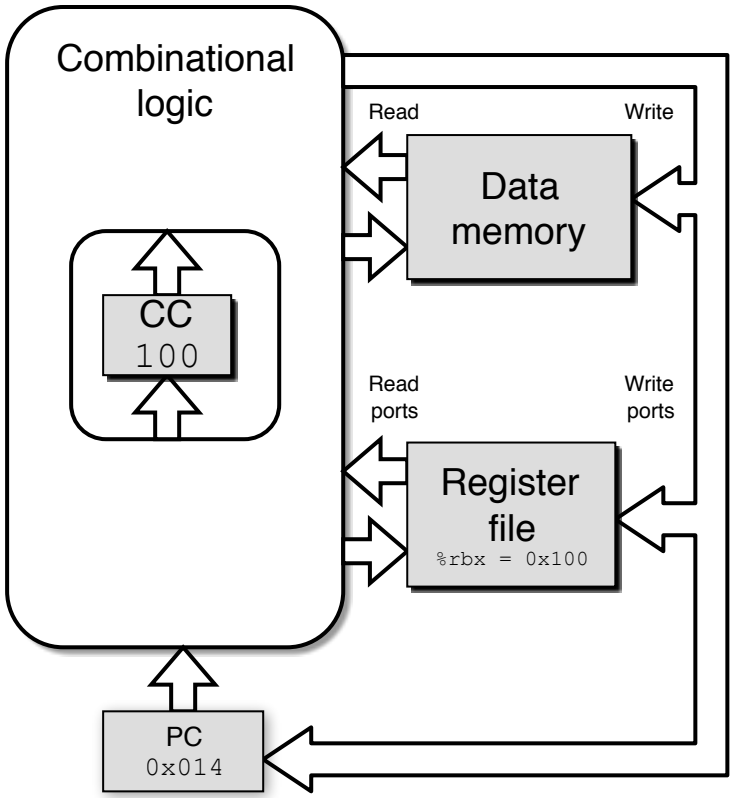
States (All updated as clock rises)

- PC register
- Cond. Code register
- Data memory
- Register file

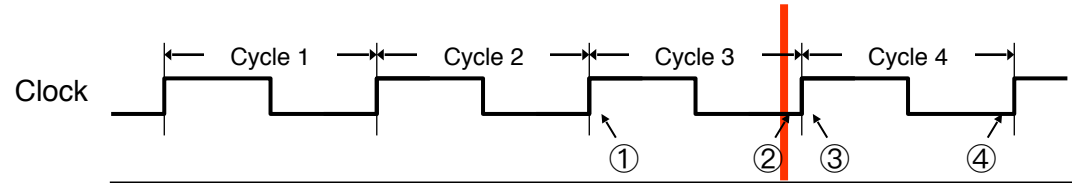




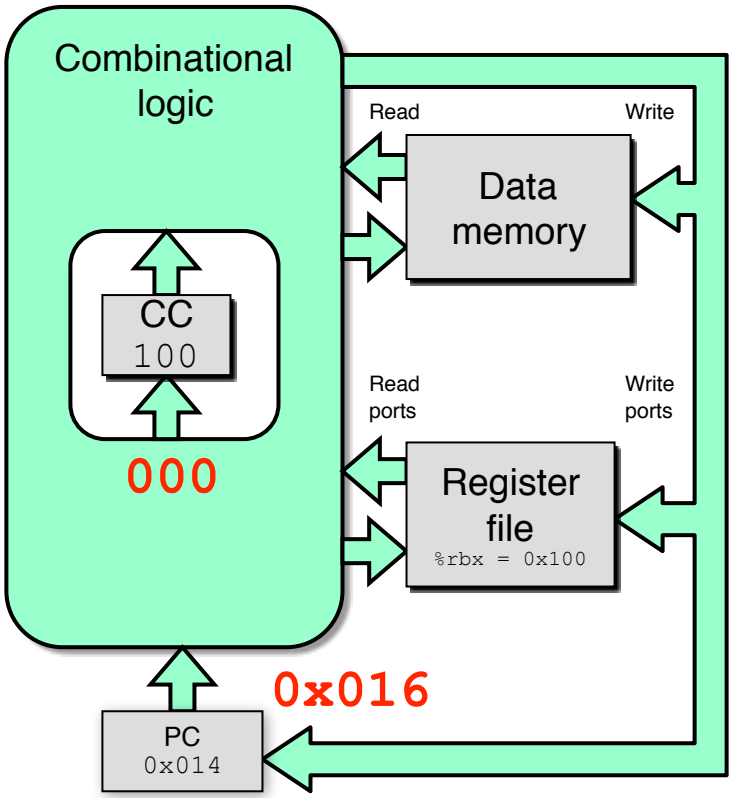
Cycle 1:	0x000:	irmovq $0x100,%rbx	# %rbx <-- 0x100
Cycle 2:	0x00a:	irmovq $0x200,%rdx	# %rdx <-- 0x200
Cycle 3:	0x014:	addq %rdx,%rbx	# %rbx <-- 0x300 CC <-- 000
Cycle 4:	0x016:	je dest	# Not taken
Cycle 5:	0x01f:	rmmovq %rbx,0(%rdx)	# M[0x200] <-- 0x300



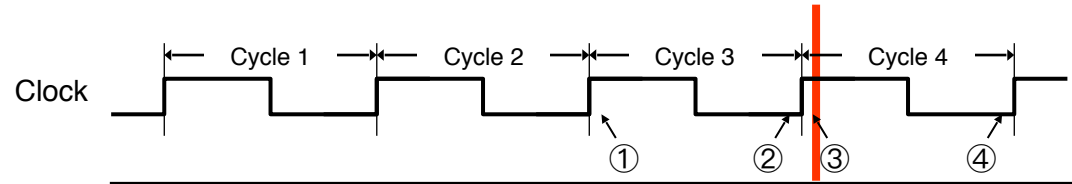
- state set according to second `irmovq` instruction
- combinational logic starting to react to state changes



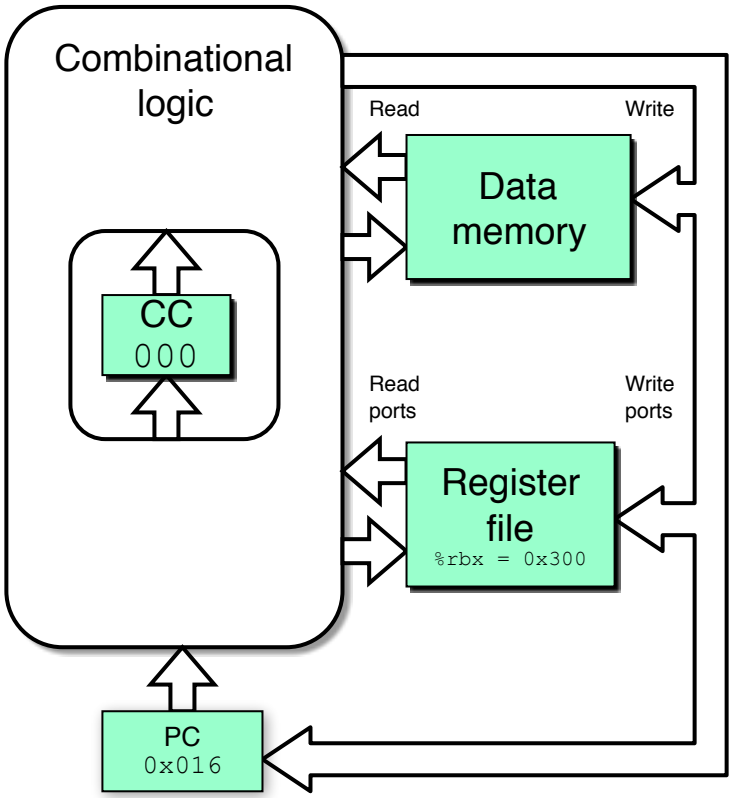
Cycle 1:	0x000:	irmovq $0x100,%rbx	# %rbx <-- 0x100
Cycle 2:	0x00a:	irmovq $0x200,%rdx	# %rdx <-- 0x200
Cycle 3:	0x014:	addq %rdx,%rbx	# %rbx <-- 0x300 CC <-- 000
Cycle 4:	0x016:	je dest	# Not taken
Cycle 5:	0x01f:	rmmovq %rbx,0(%rdx)	# M[0x200] <-- 0x300



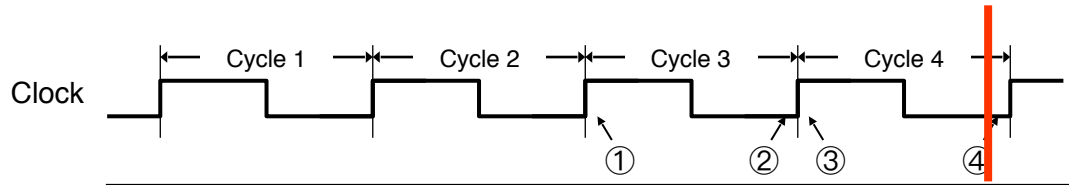
- state set according to second `irmovq` instruction
- combinational logic generates results for addq instruction



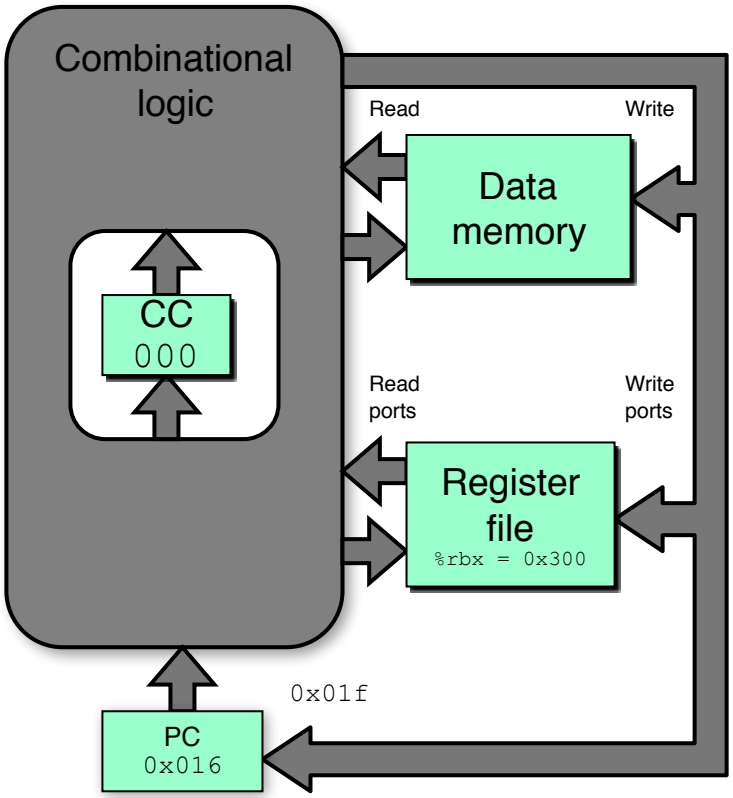
Cycle 1:	0x000:	irmovq $0x100,%rbx	# %rbx <-- 0x100
Cycle 2:	0x00a:	irmovq $0x200,%rdx	# %rdx <-- 0x200
Cycle 3:	0x014:	addq %rdx,%rbx	# %rbx <-- 0x300 CC <-- 000
Cycle 4:	0x016:	je dest	# Not taken
Cycle 5:	0x01f:	rmmovq %rbx,0(%rdx)	# M[0x200] <-- 0x300



- state set according to `addq` instruction
- combinational logic starting to react to state changes



Cycle 1:	0x000:	irmovq $0x100,%rbx	# %rbx <-- 0x100
Cycle 2:	0x00a:	irmovq $0x200,%rdx	# %rdx <-- 0x200
Cycle 3:	0x014:	addq %rdx,%rbx	# %rbx <-- 0x300 CC <-- 000
Cycle 4:	0x016:	je dest	# Not taken
Cycle 5:	0x01f:	rmmovq %rbx,0(%rdx)	# M[0x200] <-- 0x300



- state set according to `addq` instruction
- combinational logic generates results for `je` instruction

Another Way to Look At the Microarchitecture

Principles:

- Execute each instruction one at a time, one after another
- Express every instruction as series of simple steps
- Dedicated hardware structure for completing each step
- Follow same general flow for each instruction type

Fetch: Read instruction from instruction memory

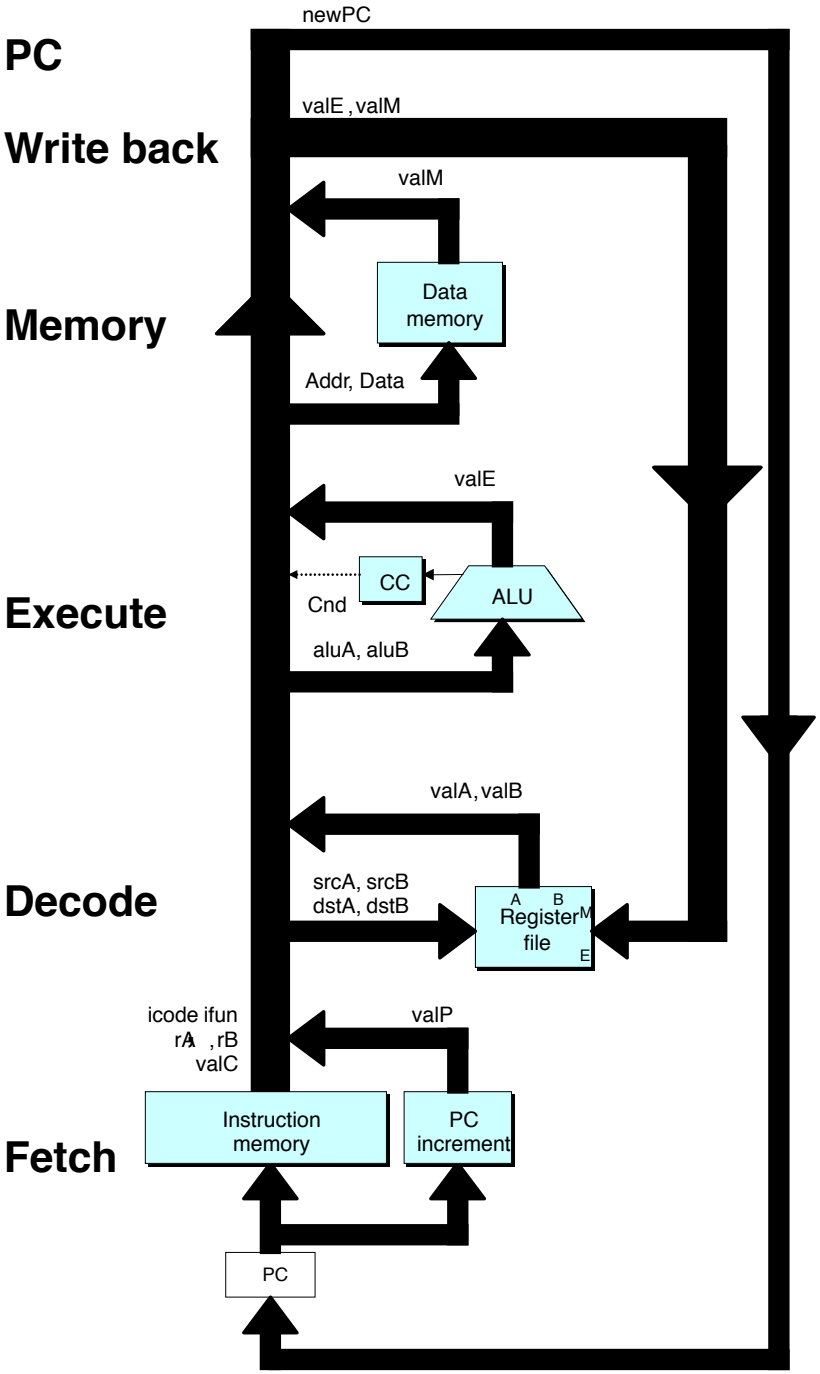
Decode: Read program registers

Execute: Compute value or address

Memory: Read or write data

Write Back: Write program registers

PC: Update program counter



Fetch

- Read instruction from instruction memory

Decode

- Read program registers

Execute

- Compute value or address

Memory

- Read or write data

Write Back

- Write program registers

PC

- Update program counter

Pipelined

Real-World Pipelines: Car Washes

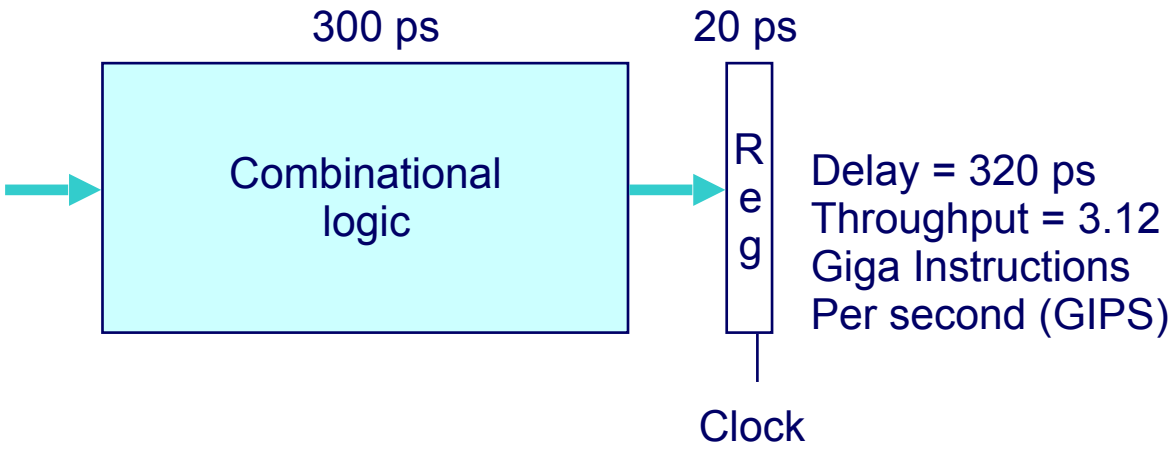
Sequential

Pipelined

Idea

- Divide process into independent stages
- Move objects through stages in sequence
- At any given times, multiple objects being processed

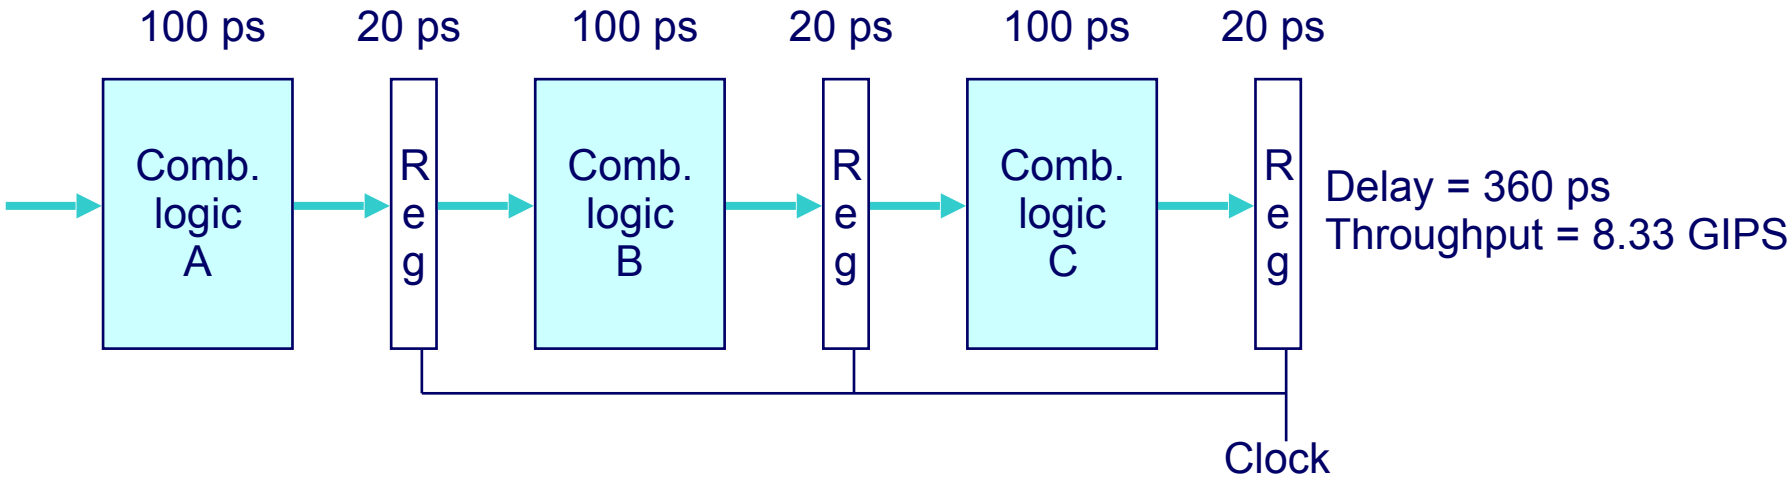
Computational Example



System

- Computation requires total of 300 picoseconds
- Additional 20 picoseconds to save result in register
- Must have clock cycle time of at least 320 ps

3-Stage Pipelined Version

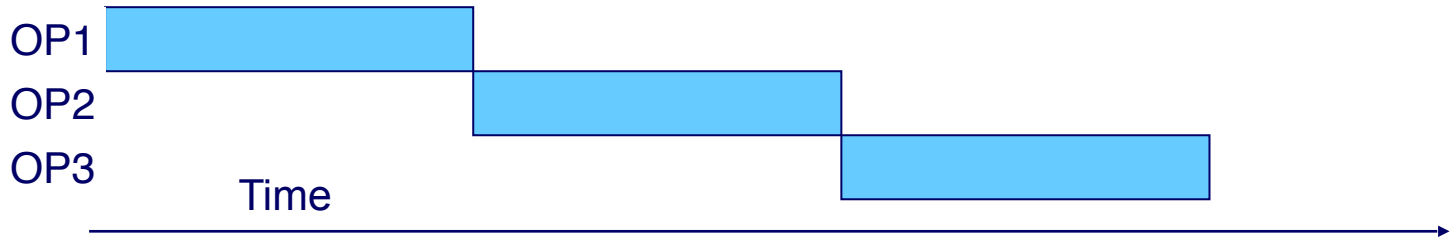


System

- Divide combinational logic into 3 blocks of 100 ps each
- Can begin new operation as soon as previous one passes through stage A.
  - Begin new operation every 120 ps
- Overall latency increases
  - 360 ps from start to finish

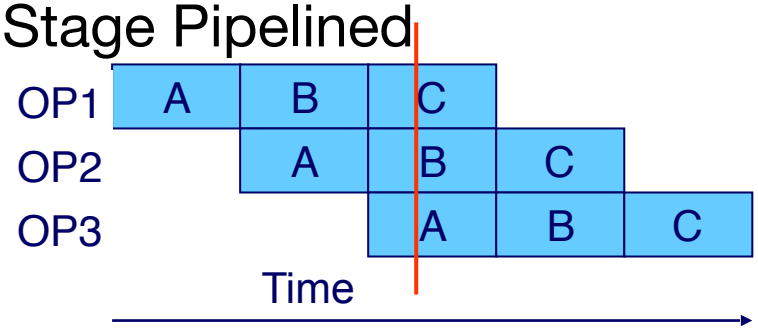
Pipeline Diagrams

Unpipelined



- Cannot start new operation until previous one completes

3-Stage Pipelined



- Up to 3 operations in process simultaneously
