

CSC 252: Computer Organization

Spring 2023: Lecture 9

Instructor: Yuhao Zhu

Department of Computer Science
University of Rochester

Announcement

- Programming assignment 2 is out. It's in x86 assembly language. Details at: <https://www.cs.rochester.edu/courses/252/spring2023/labs/assignment2.html>.

22	23	24	25	26	27	28
29	30	31	Feb 1	2	3	4
5	6	7	Today	9	10	11
12	Due	14	15	16	17	18

Announcement

- You might still have three slip days.
- Read the instructions before getting started!!!
 - You get 1/4 point off for every wrong answer
 - Maxed out at 10
- TAs are best positioned to answer your questions about programming assignments!!!
- Programming assignments do NOT repeat the lecture materials. They ask you to synthesize what you have learned from the lectures and work out something new.
- Logics and arithmetics problem set: <https://www.cs.rochester.edu/courses/252/spring2023/handouts.html>.
 - Not to be turned in.

Today: How to Implement Function Call

- What are functions and why do we use them?
- General idea of implementing functions: Stack
- Passing control
- Passing data
- Managing local data

Functions Declaration in C

Declaration (also called prototype)

- States return type, name, types of arguments

```
int Factorial(int) ;
```

Function Definition

- Must match function declaration
- Implement the functionality of the function

```
int Factorial(int n)
{
    int i;
    int result = 1;
    for (i = 1; i <= n; i++)
        result *= i;
    return result;
}
```

gives control back to
calling function and
returns value

Mechanisms in Procedures

```
P (...) {  
...  
...  
    y = Q(x);  
    print(y)  
...  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
...  
...  
    return v[t];  
}
```

Mechanisms in Procedures

- Passing control
 - To beginning of procedure code
 - Back to return point

```
P (...) {  
...  
...  
    y = Q(x);  
    print(y)  
...  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
...  
...  
    return v[t];  
}
```

Mechanisms in Procedures

- Passing control
 - To beginning of procedure code
 - Back to return point

```
P (...) {  
...  
...  
    y = Q(x);  
    print(y)  
...  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
...  
...  
    return v[t];  
}
```

Mechanisms in Procedures

- Passing control
 - To beginning of procedure code
 - Back to return point

```
P (...) {  
...  
...  
    y = Q(x);  
    print(y)  
...  
}
```

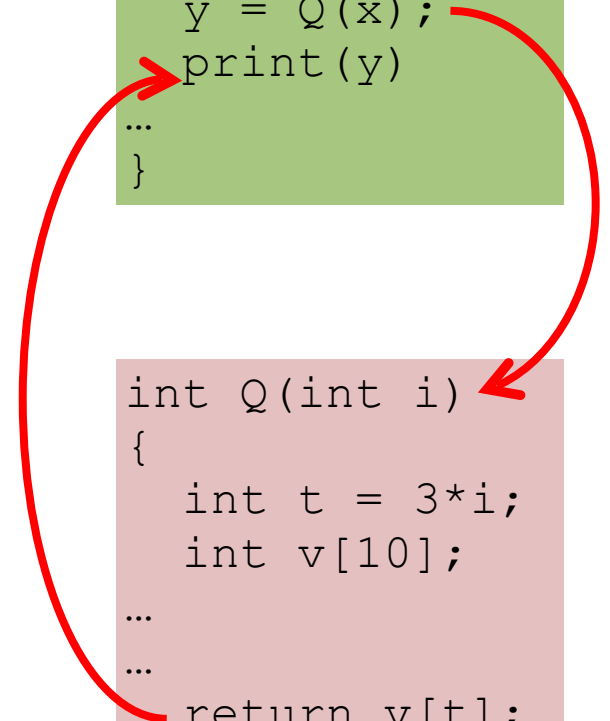

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
...  
...  
    return v[t];  
}
```

Mechanisms in Procedures

- **Passing control**
 - To beginning of procedure code
 - Back to return point
- **Passing data**
 - Procedure arguments
 - Return value

```
P (...) {  
...  
...  
    y = Q(x);  
    print(y)  
...  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
...  
...  
    return v[t];  
}
```

Mechanisms in Procedures

- **Passing control**
 - To beginning of procedure code
 - Back to return point
- **Passing data**
 - Procedure arguments
 - Return value

```
P (...) {  
...  
...  
    y = Q(x);  
    print(y)  
...  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
...  
...  
    return v[t];  
}
```

Mechanisms in Procedures

- Passing control

- To beginning of procedure code
- Back to return point

- Passing data

- Procedure arguments
- Return value

```
P (...) {  
...  
...  
    y = Q(x);  
    print(y)  
...  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
...  
...  
    return v[t];  
}
```

Mechanisms in Procedures

- **Passing control**
 - To beginning of procedure code
 - Back to return point
- **Passing data**
 - Procedure arguments
 - Return value
- **Local Memory management**
 - Allocate during procedure execution
 - Deallocate upon return

```
P (...) {  
...  
...  
    y = Q(x);  
    print(y)  
...  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
...  
...  
    return v[t];  
}
```

Mechanisms in Procedures

- **Passing control**
 - To beginning of procedure code
 - Back to return point
- **Passing data**
 - Procedure arguments
 - Return value
- **Local Memory management**
 - Allocate during procedure execution
 - Deallocate upon return
- **The ISA must provide ways (instructions) to realize all these.**

```
P (...) {  
...  
...  
    y = Q(x);  
    print(y)  
...  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
...  
...  
    return v[t];  
}
```

Today: How to Implement Function Call

- What are functions and why do we use them?
- General idea of implementing functions: Stack
- Passing control
- Passing data
- Managing local data

General Idea

- Frame (Active Record)
 - A frame refers to a piece of memory that contains (almost) all the information needed to execute a function, e.g., arguments and local variables

General Idea

- Frame (Active Record)
 - A frame refers to a piece of memory that contains (almost) all the information needed to execute a function, e.g., arguments and local variables
- When a function is called, create a frame, and push it to the memory

General Idea

- Frame (Active Record)
 - A frame refers to a piece of memory that contains (almost) all the information needed to execute a function, e.g., arguments and local variables
- When a function is called, create a frame, and push it to the memory
- When a function is returned, pop the frame out of the memory

General Idea

- Frame (Active Record)
 - A frame refers to a piece of memory that contains (almost) all the information needed to execute a function, e.g., arguments and local variables
- When a function is called, create a frame, and push it to the memory
- When a function is returned, pop the frame out of the memory
- Frames are stored in memory in a *stack* fashion

A Physical Stack: A Coin Holder

First quarter out is the last quarter in.

Initial State

After
One Push

After Three
More Pushes

After
One Pop

- Stack is the right data structure for function call / return
 - If A calls B, then B returns before A

Run-Time Stack During Function Call

Example Call Chain

```
yoo (...)  
{  
  .  
  .  
  who ();  
  .  
  return  
}
```

```
who (...)  
{  
  . . .  
  am ();  
  . . .  
  I ();  
  return;  
}
```

```
am (...)  
{  
  .  
  .  
  .  
  return;  
}
```

```
I (...)  
{  
  .  
  .  
  .  
  return;  
}
```

Run-Time Stack During Function Call

```
yoo (...)  
{  
  .  
  .  
  who ();  
  .  
  return  
}
```

Run-Time Stack During Function Call

```
yoo (...)  
{  
  .  
  who (...)  
  {  
    . . .  
    am ();  
    . . .  
  }  
  I ();  
  return;  
}
```

Run-Time Stack During Function Call

Run-Time Stack During Function Call

Run-Time Stack During Function Call

Run-Time Stack During Function Call

Run-Time Stack During Function Call

```
yoo (...)  
{  
  .  
  .  
  who ();  
  .  
  return  
}
```

Stack in X86-64

- Region of memory managed with stack discipline
- Grows toward lower addresses
- Register `%rsp` contains address of “top” element , i.e., lowest stack address

x86-64 Stack: Push

- **pushq Src**

- Fetch operand at *Src*
- Decrement **%rsp** by 8
- Write operand at address given by **%rsp**

x86-64 Stack: Push

- **pushq Src**

- Fetch operand at *Src*
- Decrement **%rsp** by 8
- Write operand at address given by **%rsp**

- Example: **pushq %rax**

x86-64 Stack: Push

- **pushq Src**

- Fetch operand at *Src*
- Decrement **%rsp** by 8
- Write operand at address given by **%rsp**

- Example: **pushq %rax**

x86-64 Stack: Push

- **pushq Src**

- Fetch operand at *Src*
- Decrement **%rsp** by 8
- Write operand at address given by **%rsp**

- Example: **pushq %rax**

- Same as (in functionality):

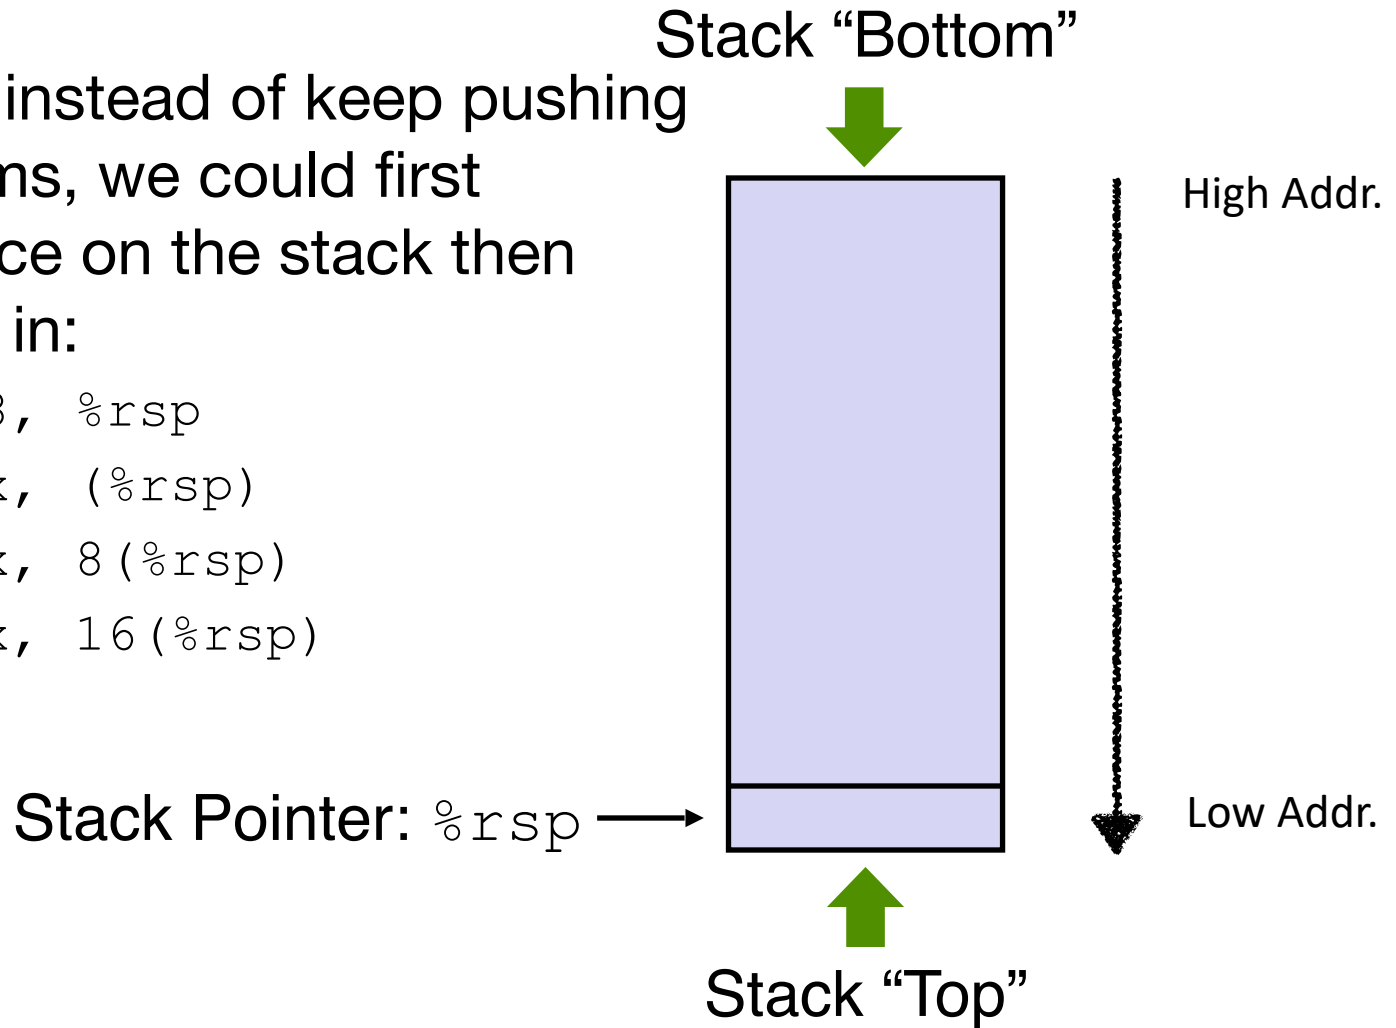

- `subq $0x08, %rsp`
- `movq %rax, (%rsp)`

x86-64 Stack: Push

- Sometimes instead of keep pushing multiple items, we could first reserve space on the stack then move items in:

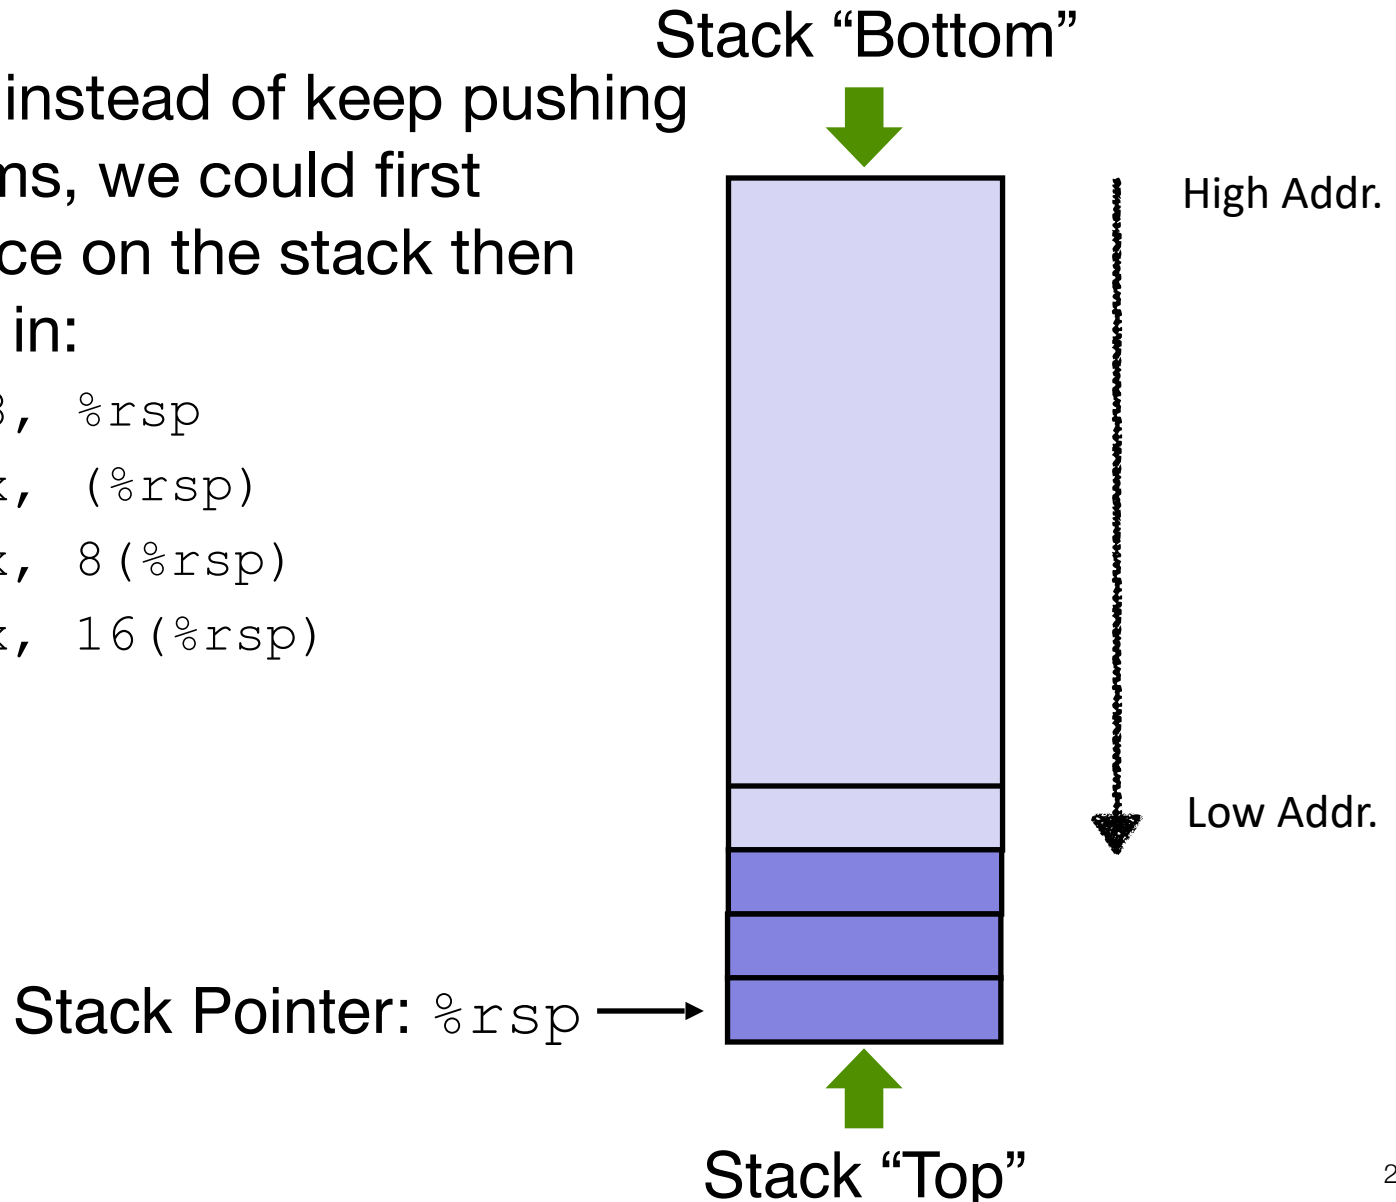

- `subq 0x18, %rsp`
- `movq %rax, (%rsp)`
- `movq %rbx, 8(%rsp)`
- `movq %rcx, 16(%rsp)`

x86-64 Stack: Push

- Sometimes instead of keep pushing multiple items, we could first reserve space on the stack then move items in:

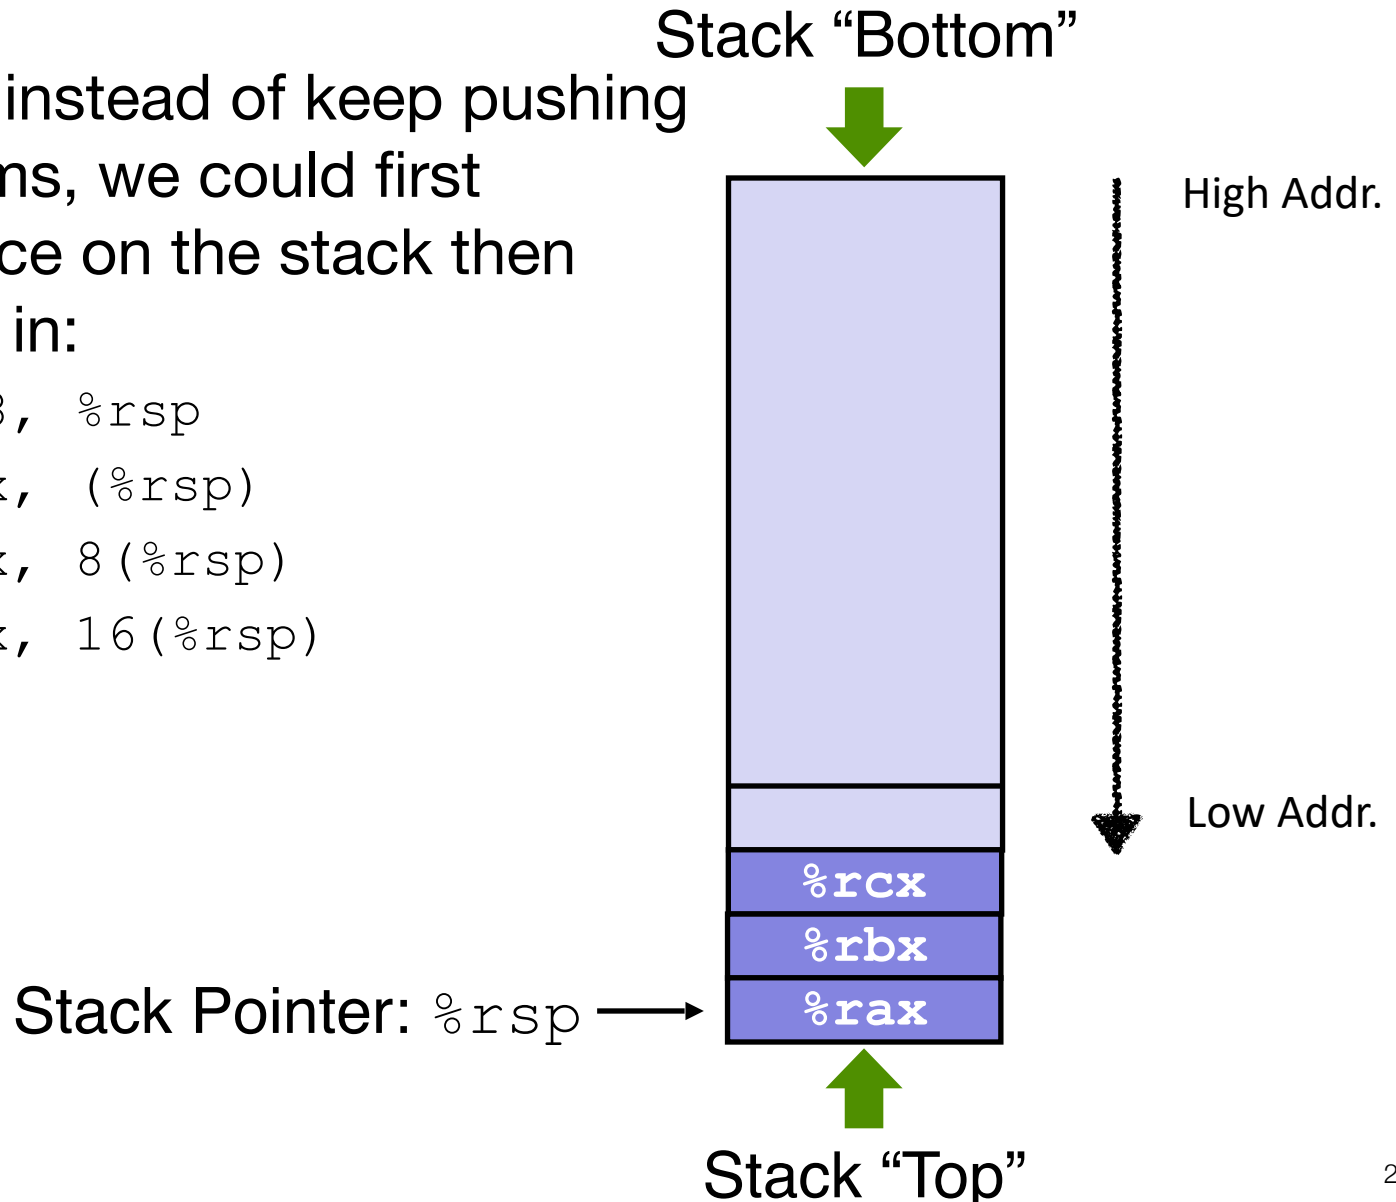

- `subq 0x18, %rsp`
- `movq %rax, (%rsp)`
- `movq %rbx, 8(%rsp)`
- `movq %rcx, 16(%rsp)`

x86-64 Stack: Push

- Sometimes instead of keep pushing multiple items, we could first reserve space on the stack then move items in:

- `subq 0x18, %rsp`
- `movq %rax, (%rsp)`
- `movq %rbx, 8(%rsp)`
- `movq %rcx, 16(%rsp)`

x86-64 Stack: Pop

- **popq *Dest***

- Read value at address given by **%rsp**
- Increment **%rsp** by 8
- Store value at *Dest* (must be register)

x86-64 Stack: Pop

- **popq *Dest***
 - Read value at address given by **%rsp**
 - Increment **%rsp** by 8
 - Store value at *Dest* (must be register)
- Example: **popq %rsi**

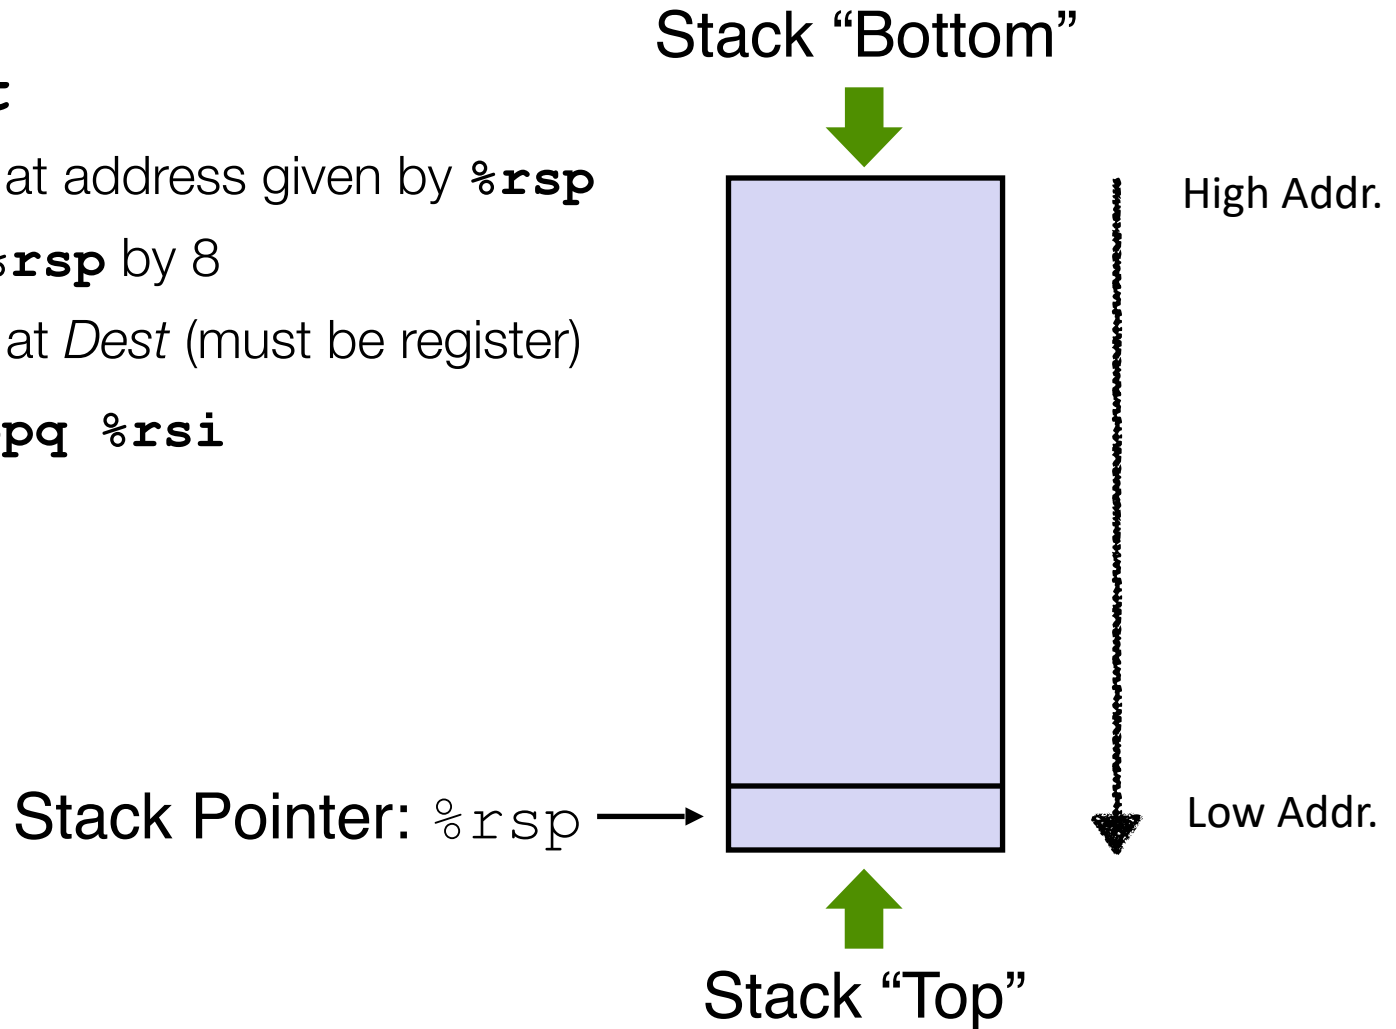

x86-64 Stack: Pop

- **popq *Dest***

- Read value at address given by **%rsp**
- Increment **%rsp** by 8
- Store value at *Dest* (must be register)

- Example: **popq %rsi**

x86-64 Stack: Pop

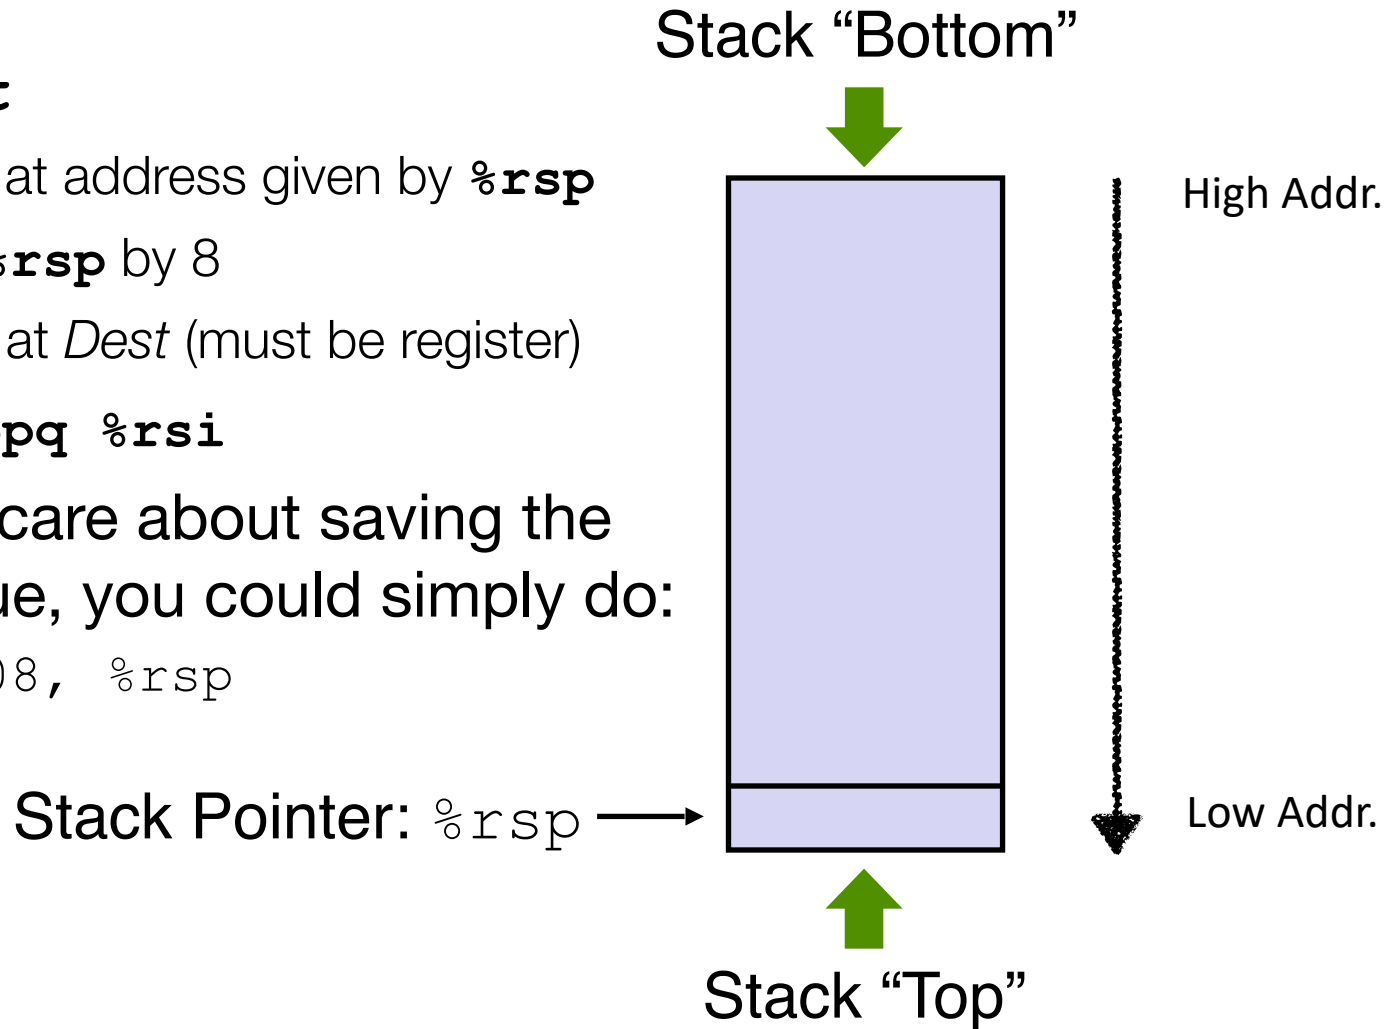

- **popq *Dest***

- Read value at address given by **%rsp**
- Increment **%rsp** by 8
- Store value at *Dest* (must be register)

- Example: **popq %rsi**

- If you don't care about saving the popped value, you could simply do:

- **addq \$0x08, %rsp**

Today: How to Implement Function Call

- What are functions and why do we use them?
- General idea of implementing functions: Stack
- **Passing control**
- Passing data
- Managing local data

Code Examples

```
void multstore  
  (long x, long y, long *dest)  
{  
    long t = mult2(x, y);  
    *dest = t;  
}
```

...

```
long mult2 (long a, long b)  
{  
    long s = a * b;  
    return s;  
}
```

Code Examples

```
void multstore
(long x, long y, long *dest)
{
    long t = mult2(x, y);
    *dest = t;
}
```

...

```
long mult2 (long a, long b)
{
    long s = a * b;
    return s;
}
```

```
400540 <multstore>:
400540: push    %rbx
400541: mov     %rdx,%rbx
400544: callq   400550 <mult2>
400549: mov     %rax, (%rbx)
40054c: pop     %rbx
40054d: retq
```

...

```
400550 <mult2>:
400550: mov     %rdi,%rax
400553: imul    %rsi,%rax
400557: retq
```

Code Examples

```
void multstore
(long x, long y, long *dest)
{
    long t = mult2(x, y);
    *dest = t;
}
```

...

```
long mult2 (long a, long b)
{
    long s = a * b;
    return s;
}
```

```
400540 <multstore>:
400540: push    %rbx
400541: mov     %rdx,%rbx
400544: callq   400550 <mult2>
400549: mov     %rax, (%rbx)
40054c: pop     %rbx
40054d: retq
```

...

```
400550 <mult2>:
400550: mov     %rdi,%rax
400553: imul    %rsi,%rax
400557: retq
```

`retq` returns to (by changing the PC) 400549.
But how would `retq` know where to return?

Non-Solution

- Replace `callq` with `jmp`
- assign a label to the instruction next to `callq` (e.g., `.L1`)
- replace `retq` with `jmpq .L1`

```
400540 <multstore>:  
  400540:  push    %rbx  
  400541:  mov     %rdx,%rbx  
  400544:  callq   400550 <mult2>  
  400549:  mov     %rax, (%rbx)  
  40054c:  pop     %rbx  
  40054d:  retq
```

...

```
400550 <mult2>:  
  400550:  mov     %rdi,%rax  
  400553:  imul    %rsi,%rax  
  400557:  retq
```

Non-Solution

- Replace `callq` with `jmp`
- assign a label to the instruction next to `callq` (e.g., `.L1`)
- replace `retq` with `jmpq .L1`

```
400540 <multstore>:
400540: push    %rbx
400541: mov     %rdx,%rbx
400544: jmp    400550 <mult2>
.L1 400549: mov     %rax, (%rbx)
40054c: pop     %rbx
40054d: retq

...

400550 <mult2>:
400550: mov     %rdi,%rax
400553: imul    %rsi,%rax
400557: jmp    .L1
```

Non-Solution

- Replace `callq` with `jmp`
- assign a label to the instruction next to `callq` (e.g., `.L1`)
- replace `retq` with `jmpq .L1`
- Will this work?!
- How about when other functions call `mult2`?

```
400540 <multstore>:
400540: push    %rbx
400541: mov     %rdx,%rbx
400544: jmp    400550 <mult2>
.L1 400549: mov     %rax, (%rbx)
40054c: pop     %rbx
40054d: retq

...

400550 <mult2>:
400550: mov     %rdi,%rax
400553: imul    %rsi,%rax
400557: jmp    .L1
```

Using Stack for Function Call and Return

- **Procedure call:** `call label`
 - Push return address on stack
 - Jump to label
- **Return address:**
 - Address of the next instruction right after call (400549 here)
- **Procedure return:** `ret`
 - Pop address from stack
 - Jump to address

```
400540 <multstore>:
400540: push    %rbx
400541: mov     %rdx,%rbx
400544: callq   400550 <mult2>
400549: mov     %rax, (%rbx)
40054c: pop     %rbx
40054d: retq

...

400550 <mult2>:
400550: mov     %rdi,%rax
400553: imul    %rsi,%rax
400557: retq
```

Function Call Example

```
400540 <multstore>:  
...  
...  
400544: callq 400550 <mult2>  
400549: mov %rax, (%rbx)  
...  
...
```

```
400550 <mult2>:  
400550: mov %rdi, %rax  
...  
...  
400557: retq
```

Stack
(Memory)

Function Call Example

```
400540 <multstore>:  
...  
...  
400544: callq 400550 <mult2>  
400549: mov %rax, (%rbx)  
...  
...
```

```
400550 <mult2>:  
400550: mov %rdi, %rax  
...  
...  
400557: retq
```

Stack (Memory)

Function Call Example

```
400540 <multstore>:  
...  
...  
400544: callq 400550 <mult2>  
400549: mov %rax, (%rbx)  
...  
...
```

```
400550 <mult2>:  
400550: mov %rdi, %rax  
...  
...  
400557: retq
```

Stack (Memory)

Function Call Example

```
400540 <multstore>:  
...  
...  
400544: callq 400550 <mult2>  
400549: mov %rax, (%rbx)  
...  
...
```

```
400550 <mult2>:  
400550: mov %rdi, %rax  
...  
...  
400557: retq
```

Stack
(Memory)

Function Call Example

```
400540 <multstore>:  
...  
...  
400544: callq 400550 <mult2>  
400549: mov %rax, (%rbx)  
...  
...
```

```
400550 <mult2>:  
400550: mov %rdi, %rax  
...  
...  
400557: retq
```

Stack Frame (So Far...)

Today: How to Implement Function Call

- What are functions and why do we use them?
- General idea of implementing functions: Stack
- Passing control
- **Passing data**
- Managing local data

Passing Function Arguments

- Two choices: memory or registers
 - Registers are faster, but have limited amount

Registers

%rdi
%rsi
%rdx
%rcx
%r8
%r9

Passing Function Arguments

- Two choices: memory or registers
 - Registers are faster, but have limited amount
- x86-64 convention (Part of the *Calling Conventions*):
 - First 6 arguments in registers, in specific order
 - The rest are pushed to stack
 - *Return value* is always in %rax

Registers

Passing Function Arguments

- Two choices: memory or registers
 - Registers are faster, but have limited amount
- x86-64 convention (Part of the *Calling Conventions*):
 - First 6 arguments in registers, in specific order
 - The rest are pushed to stack
 - *Return value* is always in `%rax`
- Just conventions, not laws
 - Not necessary if you write both caller and callee as long as the caller and callee agree
 - But is necessary to interface with others' code

(long x, long y, long *res) {
    long t = mult2(x, y);
    *res = t;
}

...
long mult2
(long a, long b)
{
    long s = a * b;
    return s;
}
```

```
0000000000400540 <multstore>:
    # x in %rdi, y in %rsi, res in %rdx
...
400541: movq    %rdx,%rbx
400544: callq   400550 <mult2>
    # t in %rax
400549: movq    %rax, (%rbx)
...
0000000000400550 <mult2>:
    # a in %rdi, b in %rsi
400550: movq    %rdi,%rax
400553: imul    %rsi,%rax
    # s in %rax
400557: retq
```

Stack Frame (So Far...)

Today: How to Implement Function Call

- What are functions and why do we use them?
- General idea of implementing functions: Stack
- Passing control
- Passing data
- Managing local data

Managing Function Local Variables

- Two ways: registers and memory (stack)
- Registers are faster, but limited. Memory is slower, but large. Smart compilers will optimize the usage.
- We will show different uses. Compiler optimizations later in the course. Take 255/455.

```
long incr(long *p, long val) {  
    long x = *p;  
    long y = x + val;  
    *p = y;  
    return x;  
}
```

Register Example: `incr`

Register	Use(s)
<code>%rdi</code>	Argument <code>p</code>
<code>%rsi</code>	Argument <code>val</code> , <code>y</code>
<code>%rax</code>	<code>x</code> , Return value

```
long incr(long *p, long val) {  
    long x = *p;  
    long y = x + val;  
    *p = y;  
    return x;  
}
```

```
incr:  
    movq    (%rdi), %rax  
    addq    %rax, %rsi  
    movq    %rsi, (%rdi)  
    ret
```

Stack Example: `call_add`

```
long call_add() {  
    long v1 = 15213;  
    long v2 = 3000;  
    long v3 = add(&v1, &v2);  
    return v2+v3;  
}
```

```
call_add:  
    subq    $16, %rsp  
    movq    $15213, (%rsp)  
    movq    $3000, 8(%rsp)  
    leaq    (%rsp), %rdi  
    leaq    8(%rsp), %rsi  
    call    add  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack

Stack Example: `call_add`

```
long call_add() {  
    long v1 = 15213;  
    long v2 = 3000;  
    long v3 = add(&v1, &v2);  
    return v2+v3;  
}
```

```
call_add:  
    subq    $16, %rsp  
    movq    $15213, (%rsp)  
    movq    $3000, 8(%rsp)  
    leaq    (%rsp), %rdi  
    leaq    8(%rsp), %rsi  
    call    add  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack

Stack Example: `call_add`

```
long call_add() {  
    long v1 = 15213;  
    long v2 = 3000;  
    long v3 = add(&v1, &v2);  
    return v2+v3;  
}
```

```
call_add:  
    subq    $16, %rsp  
    movq    $15213, (%rsp)  
    movq    $3000, 8(%rsp)  
    leaq    (%rsp), %rdi  
    leaq    8(%rsp), %rsi  
    call    add  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack

Stack Example: `call_add`

```
long call_add() {  
    long v1 = 15213;  
    long v2 = 3000;  
    long v3 = add(&v1, &v2);  
    return v2+v3;  
}
```

```
call_add:  
    subq    $16, %rsp  
    movq    $15213, (%rsp)  
    movq    $3000, 8(%rsp)  
    leaq    (%rsp), %rdi  
    leaq    8(%rsp), %rsi  
    call    add  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack

Register	Value(s)
<code>%rdi</code>	<code>&v1</code>
<code>%rsi</code>	<code>&v2</code>

Stack Example: `call_add`

```
long call_add() {  
    long v1 = 15213;  
    long v2 = 3000;  
    long v3 = add(&v1, &v2);  
    return v2+v3;  
}
```

```
call_add:  
    subq    $16, %rsp  
    movq    $15213, (%rsp)  
    movq    $3000, 8(%rsp)  
    leaq    (%rsp), %rdi  
    leaq    8(%rsp), %rsi  
    call    add  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack

Register	Value(s)
%rdi	&v1
%rsi	&v2
%rax	18213

Stack Example: `call_add`

```
long call_add() {  
    long v1 = 15213;  
    long v2 = 3000;  
    long v3 = add(&v1, &v2);  
    return v2+v3;  
}
```

```
call_add:  
    subq    $16, %rsp

    addq    $16, %rsp  
    ret
```

Stack

Stack Example: `call_add`

```
long call_add() {  
    long v1 = 15213;  
    long v2 = 3000;  
    long v3 = add(&v1, &v2);  
    return v2+v3;  
}
```

```
call_add:  
    subq    $16, %rsp  
    movq    $15213, (%rsp)  
    movq    $3000, 8(%rsp)  
    leaq    (%rsp), %rdi  
    leaq    8(%rsp), %rsi  
    call    add  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack

Stack Frame (So Far...)

Register Saving Conventions

Register Saving Conventions

- Any issue with using registers for temporary storage?

Caller

```
yoo:
...
movq $15213, %rdx
call who
addq %rdx, %rax
...
ret
```

Callee

```
who:
...
subq $18213, %rdx
...
ret
```

Register Saving Conventions

- Any issue with using registers for temporary storage?
 - Contents of register `%rdx` overwritten by `who()`

Caller

```
yoo:
...
movq $15213, %rdx
call who
addq %rdx, %rax
...
ret
```

Callee

```
who:
...
subq $18213, %rdx
...
ret
```

Register Saving Conventions

- Any issue with using registers for temporary storage?
 - Contents of register `%rdx` overwritten by `who()`
 - This could be trouble → Need some coordination

Caller

```
yoo:
...
movq $15213, %rdx
call who
addq %rdx, %rax
...
ret
```

Callee

```
who:
...
subq $18213, %rdx
...
ret
```

Register Saving Conventions

- Common conventions

- “*Caller Saved*”

- Caller saves temporary values in its frame (on the stack) before the call
 - Callee is then free to modify their values

- “*Callee Saved*”

- Callee saves temporary values in its frame before using
 - Callee restores them before returning to caller
 - Caller can safely assume that register values won't change after the function call

Register Saving Conventions

- Conventions used in x86-64 (*Part of the Calling Conventions*)
 - Some registers are saved by caller, some are by callee.
 - Caller saved: `%rdi, %rsi, %rdx, %rcx, %r8, %r9, %r10, %r11`
 - Callee saved: `%rbx, %rbp, %r12, %r13, %r14, %r15`
 - `%rax` holds return value, so implicitly caller saved
 - `%rsp` is the stack pointer, so implicitly callee saved

Example

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

Stack

Example

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    pushq    $15213  
    movq     %rdi, %rbx  
    movl     $3000, %esi  
    leaq     (%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $8, %rsp  
    popq     %rbx  
    ret
```

Stack

Example

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    pushq    $15213  
    movq     %rdi, %rbx  
    movl     $3000, %esi  
    leaq     (%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $8, %rsp  
    popq     %rbx  
    ret
```

Stack

Example

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    pushq    $15213  
    movq     %rdi, %rbx  
    movl     $3000, %esi  
    leaq     (%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $8, %rsp  
    popq     %rbx  
    ret
```

Stack

Example

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    pushq    $15213  
    movq     %rdi, %rbx  
    movl     $3000, %esi  
    leaq     (%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $8, %rsp  
    popq     %rbx  
    ret
```

Stack

Example

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    pushq    $15213  
    movq     %rdi, %rbx  
    movl     $3000, %esi  
    leaq     (%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $8, %rsp  
    popq     %rbx  
    ret
```

Stack

Example

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    pushq    $15213  
    movq     %rdi, %rbx  
    movl     $3000, %esi  
    leaq     (%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $8, %rsp  
    popq     %rbx  
    ret
```

Stack

Example

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    pushq    $15213  
    movq     %rdi, %rbx  
    movl     $3000, %esi  
    leaq     (%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $8, %rsp  
    popq     %rbx  
    ret
```

Stack

- `call_incr2` needs to save `%rbx` (callee-saved) because it will modify its value
- It can safely use `%rbx` after `call incr` because `incr` will have to save `%rbx` if it needs to use it (again, `%rbx` is callee saved)

Stack Frame: Putting It Together
